

**CITY OF SOUTH PASADENA**  
PUBLIC SAFETY COMMISSION REGULAR MEETING AGENDA

AMEDEE O. "DICK" RICHARDS, JR. COUNCIL CHAMBER  
1424 MISSION STREET, SOUTH PASADENA, CA 91030  
TEL: (626) 403-7210 • FAX: (626) 403-7211  
WWW.SOUTHPASADENACA.GOV

Monday, December 13, 2021 at 8:30 a.m.

**South Pasadena Public Safety Commission Statement of Civility**

As your appointed governing board we will treat each other, members of the public, and city employees with patience, civility and courtesy as a model of the same behavior we wish to reflect in South Pasadena for the conduct of all city business and community participation. The decisions made today will be for the benefit of the South Pasadena community and not for personal gain.

**PUBLIC ADVISORY: THE CITY COUNCIL CHAMBERS WILL BE OPEN TO THE PUBLIC**

Pursuant to Section 3 of Executive Order N-08-21, issued by Governor Newsom the Regular Meeting of the Public Safety Commission for December 13, 2021 will be conducted in-person/hybrid and held by video conference, beginning at 8:30 a.m.

Beginning in August, the City will resume in-person/hybrid public meetings. The in-person/virtual hybrid meetings will maintain transparency and public access while protecting the health and safety of the public. Members of the public have the option to participate in-person or via Zoom using the following link:

To maximize public safety while still maintaining transparency and public access, members of the public can observe the meeting via Zoom Webinar in one of the methods below.

**Public Safety Commission  
Zoom Webinar Information  
Meeting ID: 844 0935 4717**

1. Go to the Zoom website, <https://zoom.us/join> and enter the Zoom Webinar information accordingly; or

Click the following link to join the webinar: <https://us06web.zoom.us/j/84409354717>

2. You may listen to the meeting by calling: **+16699006833** and entering the Zoom Webinar ID when prompted to do so.

For additional Zoom assistance with telephone audio, you may find your local number at: <https://zoom.us/j/9171111111>

**IMPORTANT NOTE:** Members of the public may access the meeting to observe the meeting's proceedings; however, at this time, there is no live, real-time participation by members of the public.

**PUBLIC COMMENTS:** If you would like to comment on an agenda item or make a general public comment, members of the public may submit their comments in writing, for Commission consideration, by emailing them to: [psscpubliccomment@southpasadenaca.gov](mailto:psscpubliccomment@southpasadenaca.gov)

Public Comments must be received by **6 p.m., December 12, 2021** to ensure adequate time to compile. Public Comment portion of the email is limited to 250 words. Please make sure to indicate: 1) your name; 2) what agenda item you are submitting public comment on or if it is a general public comment; and 3) clearly state if you wish for your comment to be read.

**CALL TO ORDER** Chair Amin Alsarraf

**ROLL CALL** Commission members Grace Liu Kung, Jeremy Ding, Ed Donnelly, Lisa Watson, Lindsey Angelats; Vice-Chair Stephanie Cao; and Chair Amin Alsarraf

**COUNCIL LIAISON:** Jon Primuth

### **PUBLIC COMMENTS AND SUGGESTIONS**

The Public Safety Commission welcomes public input. Members of the public may address the Public Safety Commission by emailing: [psscpubliccomment@southpasadenaca.gov](mailto:psscpubliccomment@southpasadenaca.gov)  
Public Comments must be received by **6 p.m., December 12, 2021** to ensure adequate time to compile. Public Comment portion of the email is limited to 250 words. Please make sure to indicate: 1) your name; 2) what agenda item you are submitting public comment on or if it is a general public comment; and 3) clearly state if you wish for your comment to be read.

Pursuant to state law, the Public Safety Commission may not discuss or take action on issues not on the meeting agenda, except that members of the Public Safety Commission or staff may briefly respond to statements made or questions posed by persons exercising public testimony rights (Government Code Section 54954.2). Staff may be asked to follow up on such items.

#### **1. Public Comment – General**

### **ACTION/DISCUSSION**

#### **2. Minutes of the Public Safety Commission Meeting of October 18, 2021**

Recommendation

It is recommended that the Commission review and approve the October 18, 2021 Meeting Minutes.

**3. Police Department Electric Vehicle Purchase**

Recommendation

It is recommended that the Commission discuss the Police Department Electric Vehicle Purchase.

**COMMUNICATIONS**

**4. City Council Liaison Communications**

**5. Staff Liaison Communications**

**6. Commissioner Communications**

**ADJOURNMENT**

**PUBLIC ACCESS TO AGENDA DOCUMENTS**

The complete agenda packet may be viewed on the City's website at:

<https://www.southpasadenaca.gov/government/boards-commissions>

Meeting recordings will be available for public viewing after the meeting. Recordings will be uploaded to the City's YouTube Channel no later than the next business day after the meeting.

The City's YouTube Channel may be accessed at:

[https://www.youtube.com/channel/UCnR169ohzi1AIewD\\_6sfwDA/featured](https://www.youtube.com/channel/UCnR169ohzi1AIewD_6sfwDA/featured)

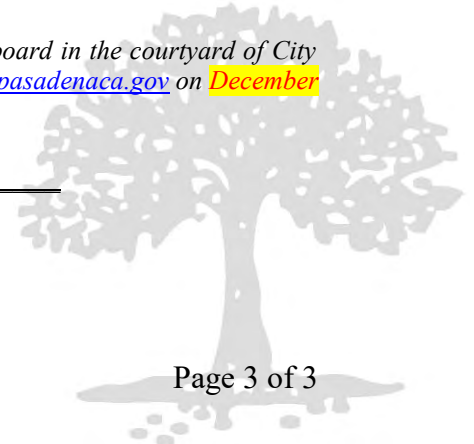

**ACCOMMODATIONS**

The City of South Pasadena wishes to make all of its public meetings accessible to the public. If special assistance is needed to participate in this meeting, please contact the City Clerk's Division via e-mail at [CityClerk@southpasadenaca.gov](mailto:CityClerk@southpasadenaca.gov) or by calling (626) 403- 7230. Upon request, this agenda will be made available in appropriate alternative formats to persons with disabilities. Notification at least 48 hours prior to the meeting will assist staff in assuring that reasonable arrangements can be made to provide accessibility to the meeting (28 CFR 35.102-35.104 ADA Title II).

*I declare under penalty of perjury that I posted this notice of agenda on the bulletin board in the courtyard of City Hall at 1414 Mission Street, South Pasadena, CA, and the City's website at [www.southpasadenaca.gov](http://www.southpasadenaca.gov) on **December 8, 2021** as required by law.*

12/8/2021 \_\_\_\_\_  
Date

Brian Solinsky, Police Chief

**MONDAY, OCTOBER 18, 2021  
MINUTES OF THE REGULAR MEETING OF THE  
PUBLIC SAFETY COMMISSION  
OF THE CITY OF SOUTH PASADENA**

**CALL TO ORDER**

A Regular Meeting of the Public Safety Commission was called to order by Chair Alsarraf on Monday, October 18, 2021, at 8:33 a.m., in the Amedee O. “Dick” Richards, Jr., Council Chamber, located at 1424 Mission Street, South Pasadena, California.

**ROLL CALL**

**Present:** Commissioners: Grace Liu Kung, Jeremy Ding, Lisa Watson, Lindsay Angelats, Vice-Chair Cao and Chair Amin Alsarraf.

**Absent:** Commissioner Donnelly

**Officials**

**Present:** City Council Liaison Jon Primuth, Police Chief/Staff Liaison Brian Solinsky, Fire Chief/Staff Liaison Paul Riddle, and Police Department Clerk/Recording Secretary Laura Mendez / Interim City Clerk Christina Munoz.

**Absent:** None

**PUBLIC COMMENTS AND SUGGESTIONS**

1. No Public Comments

**ACTION/DISCUSSION**

2. Minutes of the Public Safety Commission Meeting of September 13, 2021

MOTION BY COMMISSIONER ANGELATS, AND SECOND BY VICE-CHAIR CAO, CARRIED 6-0, to approve the Minutes of the September 13, 2021 Public Safety Commission Regular Meeting.

3. **Potential New Ordinance for the South Pasadena Municipal Code Regarding Prohibiting the Sale of All Tobacco Products**

**Public Comment**

ERNEST ARNOLD, A long term South Pasadena Resident spoke about his support for Fair Oaks Cigars and Spirits to express concern of how this Ordinance will affect this business.

RIDA BEEBE, express her disappointment with the Ordinance and gave multiple examples of why this Potential Ordinance should not be approved.

FAYEZ KARROUM, Is the Business owner of Fair Oaks Cigars and Spirits and made a state on how this Ordinance will affect his business of 24 years.

THOMAS TORICES, MD, Executive Director, AAP-CA2 Stated is in support of the Ordinance.

CHRISTINA CARDENAS Senior Project Manager with LAC USC Medical Center Foundation, Stated she is in support of the Ordinance.

ODOM STAMPS Is a Resident, Former Mayor and Business Owner expressed support for Fair Oaks Cigars and Spirits to stay in business and for the Ordinance to not be approved.

JULIE RUEDAS, Policy Analyst with the Los Angeles County USC Medical County Foundation Stated that she is in support of this Ordinance.

KARINNE VAN GRONINGEN, MD PEDIATRICINAS for Los Angeles County, She is in support of the Ordinance.

MYRON QUON, Stated support for the Ordinance to pass.

POLICE CHIEF BRIAN SOLINSKY informed that City Council in an effort to promote a safe healthier environment and lifestyle for its residents, City Council had directed staff to research a policy banning the sales of tobacco within South Pasadena, Several city across the nation have implemented similar bans banning flavored tobacco products however. South Pasadena will be if passed would be one of three cities Manhattan Beach and Beverly Hills to ban all Tobacco products. The goal of the Ordinance is aimed at reducing opportunities for youth and minority residents from beginning tobacco use or targeted by large tobacco companies as future tobacco consumers. To speak more on the subject Management Analyst Alison Wehrle.

ALISON WEHRLE MANAGEMENT ANALYST, reiterated what Police Chief Brian Solinsky said about the two Cities that have banned the sale of Tobacco Products within the City. Management Analyst Wehrle communicated some differences between the two cities who have implemented this Ordinance. The goal of the Ordinance is not to close businesses, it is an opportunity to reduce availability for youth in the City, and provide growth opportunities for the local businesses.

DR. TONY KUO, MD DIRECT THE DIVISION OF CHRONIC DISEASE AND INJURED PREVENTION FOR LOS ANGELES COUNTY DEPARTMENT OF PUBLIC HEALTH, Provided some facts and information on the health and economics and toll of Tobacco use.

POLICE CHIEF SOLINSKY Reiterated that it was staff recommendation that an exemption be created for the one existing Cigar Shop, primarily because 90% of income comes from the sales of Cigars and related products. It was also Staff's recommendation that we create a six month grace period that would allow the existing businesses to sale their existing inventory or to take advantage of programs offered.

MONTY MESSAX MPH for Los Angeles County Department of Public Health gave some insights on The City of Beverly Hills and Manhattan Beach and stated that none of the two cities have faced legal challenge about the Tobacco Ordinance.

MOTION BY COMMISSIONER DING, AND SECOND BY CHAIR ALSARRAF, CARRIED 6-0, Staff to revisit the report and the Ordinance with the following feedback from the Commission, that the ban should be for all Tobacco Products that there should be interim in nature with an effective date that would allow retailers to determine the degree of hardship to their business. Have a set date where it could be revisited after the termination of the set date that the ban apply to all tobacco products in the city. The exemption and the hardship process be more structured with regard to how long it is how its approved who approved it, and the ban should not allow for any new tobacco retailers in the city.

## COMMUNICATIONS

### 1. City Counsel Liaison Communications

City Council Liaison Primuth had no communications.

### Staff Liaison Communications

**Fire Chief Riddle** informed the Fire Department remains fully staffed as we are still navigating through the pandemic two important points that will be coming back to the Commission is that it has been a busy wild fire season that we have faced with two or three of the biggest wild fires in history. Staff and the Fire Department have been meeting

with Edison and discussing the public safety shut offs that have been effecting the regions, South Pasadena has not have any shut offs.

Chief Riddle commented on a Public Comment stating that some fire men did not wear a mask when out on at a school. Chief Riddle pointed out that the health order was an old health order and it is not their intentions to not follow the health orders.

**Police Chief Solinsky** announced that the Men’s Central Jail will be closing, The Board of Supervisors voted for it to close. There is some concerns of how that will impact our Community. The Jail will close, but Katherine Barger the Los Angeles County Supervisor is looking to replace it with Mental Health Facility. Chief would like the Commission to support and write a letter of support about this or reach out to Supervisor Barger.

## 2. Commissioner Communications

**Commissioner Angelats** stated she supports Chief Solinsky on the letter to be written for Los Angeles County Supervisor Katherine Barger in support of the Mental Health Facilities.

**Commissioner Cao** agrees with Commissioner Angelats on a letter in support of the conversion of the Jail.

**Commissioner Liu Kung** informed that Public Schools since the reopening of schools back in August less than a dozen cases have been reported in the District. This Thursday, October 21<sup>st</sup> is the Great Shakeout Earthquake Drill at the schools. She supports everyone and appreciates everyone’s efforts on the Commission.

**Chair Alsarraf** would like to thank everyone for the comments and discussions and appreciated the community members for coming out to the meeting. October is Domestic Violence Awareness Month and City Council had a presentation.

<b>ADJOURNMENT</b>
--------------------

Chair Alsarraf adjourned the meeting at 10:43 a.m.

Respectfully Submitted:

Approved By:

Amin Alsarraf /  
Chair

# Public Safety Commission Agenda Report

ITEM NO. \_3\_

**DATE:** December 13, 2021

**FROM:** Brian Solinsky, Police Chief  
Paul Riddle, Fire Chief  
Tony Abdalla, Police Sergeant

**SUBJECT:** **Police and Fire Department Fleet Transition to Battery Electric Vehicles**

---

## **Recommendation**

It is recommended that the Commission review and recommend to the City Council the Police Department transition their entire vehicle fleet, and the Fire Department transition their administrative vehicle fleet, to Battery Electric Vehicles (BEVs).

## **Commission Review and Recommendation**

On December 6, 2021, the Natural Resources and Environmental Commission recommended to the City Council that the Police Department transition their entire vehicle fleet, and the Fire Department transition their administrative vehicle fleet, to battery electric vehicles. This recommendation was made in concert with the Commission's consideration of the electric vehicle charging infrastructure necessary to support this transition through the Charge Ready program.

## **Community Outreach**

This matter was reviewed at several community outreach events during the development process and eventual adoption of the City's 2020 Climate Action Plan.

## **Discussion/Analysis**

The South Pasadena Police Department currently owns and maintains twenty-three (23) Internal Combustion Engine (ICE) vehicles used to provide public safety services to the community on a 24/7 basis. The Fire Department owns and maintains two (2) administrative ICE vehicles. The Police Department's aging fleet is used extensively in response to public safety operations and is increasingly having maintenance issues which do not provide the reliability and capability that our police officers require.

Police Department staff has conducted extensive research and due diligence into BEVs, manufacturers, and related technology. That research resulted in identifying Tesla, Inc. as the clear market-leading manufacturer of BEVs. Police Department staff also conducted comparison research to identify other law enforcement agencies where Tesla BEVs are currently deployed.

# Police and Fire Department Transition to Battery Electric Vehicles

December 13, 2021

Page 2 of 5

Police Department staff has identified twenty (21) law enforcement agencies across the United States who have integrated Tesla BEVs into their fleet over the past year.

The clear standout in that research with very similar, if not identical, needs was the Fremont, CA Police Department. In a life cycle comparison study (@90,000 miles/5 years) conducted by the Fremont PD (Attachment 1) between a Gas Ford Police Pursuit Vehicle (PPV) and their 2014 Tesla Model S85 pilot vehicle, Fremont PD is expected to realize a \$27,977 savings in energy/fuel costs, \$11,677 savings in maintenance costs and 100% reduction or 210,994 lbs of CO2 per vehicle over a five year period based upon data compiled during their one year pilot study. With a recent City purchase of gasoline at \$3.81 per gallon vs. \$3.00 per gallon in the Fremont PD study, our Police Department is anticipating energy cost savings approximately 27% greater than those realized by Fremont PD. We would expect our maintenance costs and GHG emission reduction to be consistent with that projected by Fremont PD.

As Tesla BEV products have matured to the point where they now meet or exceed the operational needs of both the Police and Fire Department, we are proposing to transition the Police Department's entire fleet, and the Fire Department's administrative fleet, to Tesla BEVs pursuant to the adopted 2020 Climate Action Plan (CAP) through a vehicle-leasing program. The Tesla Model Y (Attachment 2) has been identified as being suitable for Police Department patrol operations and the Model 3 for administrative and Detective use.

## Background

In an effort to reduce costs, improve efficiencies and ensure the City advances the goals and objectives in the 2020 CAP and 2020 General Plan Update Draft, the Police Department is proposing to transition its current ICE vehicle fleet to BEVs, and the Fire Department to transition its ICE administrative fleet to BEVs. It is well established that BEVs substantially reduce energy and maintenance costs of fleet operations while simultaneously eliminating Greenhouse Gas (GHG) emissions.

Factors	2021 Tesla Model Y	Gas Ford PPV
Vehicle Cost	\$59,940	\$40,716
Standard Equipment Upfitting Cost	\$17,000	\$12,983
Modifications Above/Beyond Standard Equipment Upfitting Cost	\$4,000	
OEM Range (EPA)	330 miles (74kWh battery)	344 miles (18.6 gal tank capacity)
Cost of Energy	\$.10 kWh average	\$3.81 per gal
Cost for Capacity Fill	\$7.40	\$70.87
Est. Annual Maintenance/Repair Cost	\$710	\$2,331
Avg. Annual CO2 Emissions	0 lbs.	42,198 lbs.

Transitioning now to an all BEV fleet will significantly advance the City on a meaningful trajectory towards the primary goal of reaching GHG emissions targets in 2030, and ultimately towards reaching carbon neutrality by 2045 as detailed in the CAP, adopted by the City Council on December 16, 2020. The resulting reduction in GHG related to this program is measurable, quantifiable and can be tracked through CAPDash.

According to the United States Environmental Protection Agency (EPA), each gallon of gasoline burned produces 8,887 grams or 19.6 pounds of CO<sub>2</sub><sup>1</sup>. On an annual basis, a gas-powered Ford Patrol Vehicle (FPV) is responsible for producing approximately 42,198 pounds, or 19.14 metric tons, of CO<sub>2</sub> emissions (Attachment 2). Additionally, current administrative vehicles in the police and fire department fleets produce approximately 4.6 metric tons of CO<sub>2</sub> emissions annually, according to EPA data.

By reducing the police department fleet to twenty (20) vehicles from the current twenty-three (23) vehicles and replacing them with BEVs, combined with the Fire Department replacing two (2) administrative vehicles with BEVs and implementing a third, an estimated reduction of approximately 2,687 metric tons of CO<sub>2</sub> is projected to be realized by 2030. These 2,687 metric tons of CO<sub>2</sub> represents 14.5% of the City's overall 2030 GHG emissions reduction target of 18,578 metric tons of CO<sub>2</sub>e to meet state goals (Attachment 3). The M.2 Play GHG Emissions Reduction Contribution as detailed in the CAP through the electrification of the municipal fleet and mobile equipment is 23 metric tons by 2030. If implemented as proposed, the conversion of the Police Department fleet and Fire Department administrative fleet to BEVs is estimated to exceed the CAP's M.2 GHG emissions reduction goal by 2,664 metric tons by 2030.

### **Why Tesla?**

Safety, reliability, and performance are critical elements of successful public safety fleet operations. Plagued by recent significant recalls and performance issues by General Motors and Ford related to the Chevy Bolt and Mach-E respectively, legacy ICE automakers are struggling to transition to the manufacture of all-electric vehicles at scale and have yet to demonstrate mature, reliable products in the BEV space. As a result of our extensive research of all-electric product offerings from existing legacy auto manufacturers, none were found to be immediately suitable for our needs.

Tesla was purpose built from the very beginning to address the negative impacts of climate change. Founded in 2003, Tesla's mission is to "Accelerate the world's transition to sustainable energy." Over the course of the next 13 years, Tesla has evolved and emerged as the all-electric EV market leader with the safest, most mature products with advanced technology. Tesla's corporate philosophy perfectly aligns with the City's CAP and related goals.

In addition to the local benefits that will be realized by this proposed adoption, it is also important to Police and Fire Department staff that any transition to BEVs results in meaningful, positive environmental impact at the national and potentially global level. In 2020, Tesla

---

<sup>1</sup> <https://www.epa.gov/greenvehicles/greenhouse-gas-emissions-typical-passenger-vehicle>

released their Impact Report (Attachment 4). The objective of their Environmental, Social and Governance (ESG) Impact Report is to disclose the impact Tesla has on those three areas, as well as to present, to the extent possible, data and other information qualifying and quantifying that impact. The Impact Report comprehensively addresses and details Tesla's global environmental impact from supply chain, through manufacturing, to vehicle use, and vehicle end-of-life. It is clear from the Impact Report that Tesla is leading the EV automobile industry in minimizing negative climate and social impacts across the entire EV lifecycle through responsible corporate governance.

### **Charging Infrastructure**

Charging infrastructure sufficient to support an all BEV fleet is a critical component to the success of this program and towards the long-term goal of a sustainable, carbon neutral energy future. Working in partnership with Southern California Edison (SCE) and our Public Works and Fire Departments, we are currently re-imagining our fleet parking lot areas to support the installation of chargers, solar panels and battery storage. The results and recommendations resulting from this work will be brought before the City Council in a separate, but complementary, capital improvement project and will require an investment as detailed in the CAP.

Charging infrastructure redundancy is an important consideration for public safety entities in the event of power grid disruptions. Tesla has built out a network of Superchargers to support the charging needs of their products, which is growing every day. With 30,000+ Superchargers, Tesla owns and operates the largest global, fast charging network in the world. The recently constructed and publicly available twenty (20) stall Tesla Supercharger location at Glenarm Street and the Pasadena (110) Freeway is ideally suited to meet our charging infrastructure redundancy and supplemental energy needs.

The Glenarm Supercharger site is supplied with electricity from the Pasadena Department of Water & Power, a completely independent provider of electricity from which we currently source from SCE. Availability of electricity from multiple sources to support our BEV charging needs minimizes the risk of concurrent outages. Installation of chargers, solar panels and battery storage at the City Hall complex will further enhance redundancy and put us on the road to sustainable energy independence for our fleet operations.

### **Fiscal Impact**

The Police Department is projected to realize a cost savings of approximately \$215,881 over a ten (10) year period. The fiscal impact related to the Fire Department is still being determined.

### **Public Notification of Agenda Item**

The public was made aware that this item was to be considered this evening by virtue of its inclusion on the legally publicly noticed agenda, posting of the same agenda and reports on the City's website.

Police and Fire Department Transition to Battery Electric Vehicles

## PILOT PROGRAM TIMELINE

- 2015 – Developed pilot program idea in support of the City’s policy to identify and implement clean energy technology
- 2016 – Detailed discussions with City Manager, City Attorney, and Chief of Police
- 2017 – City leadership approved the Pilot Program
  - Various City departments formed a planning committee, including: City Manager’s Office, City Attorney’s Office, Finance, Public Works (Fleet and Building Maintenance), Community Development (Sustainability), and IT Services
  - Extensive research on various vehicle options (Tesla Model S 85 selected)
    - Visit with Los Angeles Police Department / Los Angeles Sheriff’s Department who were initiating a similar pilot program
- Late 2017/Early 2018 – Fremont Police Department (FPD) purchases and accepts delivery of a used Tesla Model S 85
  - 12-month customized build/equipment installation
- 2019 – Vehicle build completed
  - Vehicle tested at Alameda County Emergency Vehicle Operations (EVOC) track
    - Exceeded expectations and performance objectives
  - Deployment date set for March 25, 2019
    - Pilot Program initiated
  - Media and law enforcement interest nationally and internationally
    - Multiple media & community presentation requests

## PILOT PROGRAM OVERVIEW

- Program assessed the following:
  - Does the technology meet police application?
  - Is the electric vehicle durable enough for police usage?
  - Is the electric vehicle cost effective?
- Modifications to the Tesla Model S 85 included:
  - Overhead light-bar
  - Rear flashers
  - Wheel well lights
  - Headlight flashers
  - WatchGuard vehicle camera
  - Trunk lighting
  - Panasonic Mobile Digital Computer
  - Push-bumper
  - Prisoner partition
  - Prisoner seat
  - Center equipment console
  - Armor door panels for the driver and front passenger door
- Estimated \$30,000 in fuel consumed during the life span of conventional police vehicles. As a result, the project was projected to have cost savings or be cost neutral (based on purchase price of test vehicle and anticipated lifespan)
- On-campus Tesla charging station installed
  - Tesla charging station supplemented by existing on-campus electric vehicle charging stations
- Data gathered daily for six to 12 months, including:
  - Electric vehicle's average range during an 11-hour patrol shift
  - Vehicle's performance during emergency response, safety, and comfort
  - Police Officer comments and input from City's department stakeholders were also collected as an added layer of evaluation
- Ongoing media and community interest

- Government agencies throughout the nation contacted City officials for information regarding the Electric Patrol Vehicle Pilot Program
- Vehicle requested for numerous community events, parades, and presentations

# OUTCOMES

## Methodology

The Electric Patrol Vehicle Pilot Program ran from March 25, 2019 to March 25, 2020. To calculate the annual cost comparisons between the Tesla Model S 85 and the Ford Utility police pursuit vehicle (PPV), various reports were generated to collect data for each vehicle's actual or average annual cost of maintenance, repair, fuel, energy, and downtime for comparison purposes. What follows is a description of the reports and how the data was collected and presented.

The Tesla Model S 85 actual annual energy cost was derived from Geotab's "Advanced Fuel & EV Energy Report," spanning the pilot program period. To calculate energy consumption and miles driven for the Tesla, City of Fremont Fleet Services used Geotab's fleet management software and a GPS vehicle tracking device. The kilowatt-hour (kWh) energy used for miles driven was converted into kWh per mile. Then, that total was multiplied by the Pacific Gas and Electric (PGE) kWh rate of \$0.15 to get the energy cost per mile.

The Tesla Model S 85 average annual maintenance and repair costs were derived from 16 months of data and then converted to an average annual cost from the Faster 4150 Report, "Equip History: Cost and Quantity Detail Report." The yearly average maintenance and repair costs for the Tesla were calculated using data from the 16 months the vehicle has been patrolling, including the pilot program period.

The Ford Utility PPV maintenance, repair, and fuel costs were derived from 58 months of data from 10 2015 Ford Utility PPV vehicles and then converted to an average annual cost for comparison purposes.<sup>1</sup> This data was sourced from the Faster 4150 Report, "Equip History: Cost and Quantity Detail Report." The average annual fuel costs for the conventional Ford Utility PPV was determined from the

---

<sup>1</sup> The 10 2015 Ford Utility PPV vehicles were selected because they were in service the longest, came very close to the five-year life cycle of the Ford Patrols, and would give a closer true cost of maintenance/repair and fuel.

total gallons consumed and multiplied by a three-year average fuel cost of \$3.00/gallon.

The Tesla Model S 85 actual downtime, presented in both annual percentage and days, was derived from one year of data spanning March 2019 to March 2020 from the Faster 4309 report, "Downtime-Detail Report."

The Ford Utility PPV average downtime was derived from the same downtime report spanning three years of data from July 2017 to July 2020. This data was then converted to average annual downtime percentage and days. The downtime data was collected from all PPVs existing at this time, with vehicle models including Chevrolet Tahoe, Chevrolet Caprice, and Ford F150.

The actual and average annual maintenance, repair, energy, fuel, and downtime data for the Tesla Model S 85 and Ford Utility PPV are shown side-by-side for comparison purposes in the chart on page 8.

## Outcome Summary

The Pilot Program clearly established that an electric patrol vehicle is a feasible option for our City's police department. The Pilot Program affirmed the following information:

1. Does the technology meet police application?
  - Results: The Tesla Model S 85 exceeded performance and operational objectives.
2. Is the electric vehicle durable enough for police usage?
  - Results: The Tesla Model S 85 withstood the rigors of police use requiring minimal maintenance.
3. Is the electric vehicle cost effective?
  - Results: Although build cost for the Tesla Model S 85 was slightly higher than conventional police vehicles, maintenance/repair and fuel savings appears to balance or slightly reduce the overall operating cost as projected and compared to the lifespan of a police vehicle.

The chart below lists data derived from the pilot program and beyond as compared to calculated annual averages for a standard gas Ford police pursuit vehicle (PPV):

Factors	2014 Tesla Model S 85	Gas Ford PPV
Vehicle Cost	\$61,478.50 <sup>2</sup>	\$40,500
Standard Equipment Build Cost	\$35,000*	\$35,000
Modifications Above/Beyond Standard Equipment Build Cost	\$6,774.48*	\$0
OEM Range	265 miles (85kWh battery)	344 miles (18.6 tank cap)

<sup>2</sup> Tesla and City of Fremont Motor Vehicle Purchase Agreement on December 13, 2017

Actual Annual Energy/Avg. Annual Fuel Cost	\$1,036 <i>Cost of energy consumed while charging</i>	\$5,133 <i>Calculated assuming \$3.00 per gallon</i>
Avg. Annual Repair/Maintenance Cost	\$4,865	\$2,915
<b>Actual Annual Costs of Energy/ Avg. Fuel and Maintenance/Repair Costs</b>	<b>\$5,901</b>	<b>\$8,048</b>
Avg. Annual Maintenance Downtime	39.125 Days (10.72%)	66 days (17.98%)
Avg. Annual Operational CO2 Emissions	0 lbs.	42,198 lbs.

*\*Some costs were donated as part of the Pilot Program.*

After careful review, the Pilot Program was determined to be a success. The police patrol electric vehicle met the needs of police services.

## Deployment Benefits

- Performance
  - The Tesla Model S 85 met or exceeded expectations often demonstrating superior performance when compared to gas-powered police vehicles.
  - Due to the vehicle's performance, Police Officers reported an enhanced feeling of safety and control when responding to emergency calls for service.
  - Police Officers reported a reduction in anxiety and stress when responding to emergency calls for service due to fewer engine noises.
  - Police Officers reported improved radio communication due to the lack of background engine noise.
- Range and Charging
  - The Tesla Model S 85 averaged **50% power usage** during a typical patrol shift (11 hours).
  - The 265-mile range of the Tesla Model S 85 easily accommodated the 40-70-mile range that patrol vehicles drove on average per day.
  - These results provided confidence in the ability to deploy an electric vehicle (with similar range) for a standard 11-hour patrol shift.
  - Electric vehicle technology was reasonably managed utilizing available on-campus charging stations.
  - FPD currently has charging infrastructure in place to support additional electric police vehicles. Capacity, however, will be limited until expansion of charging stations is achieved.
- Durability
  - The vehicle withstood the rigorous operational demands associated with policing a mid-sized municipality.
  - City's Fleet Maintenance staff reported significant reduction in repairs, maintenance, and downtime over the course of one year when compared to current police vehicles. Due to this reduction, the Tesla Model S 85 was able to remain in service more consistently (**27 more days** than a conventional PPV).

- It is expected that the Tesla's average annual maintenance and repair costs will decrease over time as more data is available and the sample period is extended, with a roughly 50% reduction (approximately \$2,910).
- Fuel Costs and Sustainability
  - Over the course of the one-year Pilot Program, the Tesla Model S 85 reduced the cost of fuel that would have been required for a traditional gas-powered police vehicle by **\$4,097**.
  - Although only one vehicle out of a fleet of over 60 vehicles, the Tesla Model S 85 reduced greenhouse emissions produced annually by FPD.
  - The program demonstrated the effectiveness of electric vehicles in helping the City of Fremont meet its goals to reduce 2005 levels of GHG emissions by 55% by 2030 and achieve long-term carbon neutrality by 2045.
- Re-sale Value of the Model S
  - The total cost of ownership (TCO) over a five-year period was calculated for the Tesla Model S 85 at \$132,758 and the Ford Utility Interceptor at \$115,740 factoring in upfront costs such as purchase price and modification, miles driven, fuel/energy costs, and maintenance costs. However, the TCO for the Tesla Model S 85 will likely decrease over time as more data is collected and the sample period is extended. Additionally, the TCO will decrease if the vehicle exceeds 5 years of service as is projected.
  - The Tesla Model S 85 appears to **hold its value twice as well** as the average internal combustion engine (ICE) vehicle<sup>3</sup>.
  - One study calculated the average five-year depreciation of Tesla Model S 85 to be 61.7%.<sup>4</sup> Taking the depreciation to be 80% after seven years, to account for the additional age and hard driving in a police application, would decrease the TCO by about \$12,000-\$13,000.

---

<sup>3</sup> City of Fremont Municipal Fleet Electrification Study May 2020

<sup>4</sup> <https://www.iseecars.com/cars-for-sale#section=studies&study=cars-that-hold-their-value&v=2019>

- As the City continues to electrify its fleet, particularly if purchasing Tesla models or other long-range EVs for the Police Department, the potential higher resale value may reduce the TCO compared to ICE vehicles.
- Expected Lifespan
  - Initial data has indicated that the reduced maintenance needs of the Tesla Model S 85 will likely result in an expected lifespan of longer than five years. However, this assumption is still being proven through real-world application.

### Deployment Challenges

- The Tesla Model S 85 has low ground clearance which reduces its ability to traverse certain types of terrain.
- Taller drivers of 6' or above reported the position of the Tesla Model S 85's "B pillar" made it more difficult to enter/exit the vehicle when compared to traditional Ford SUV police vehicles.
- The on-campus charging stations required two to four hours of charging to reach a full charge when battery power was at 50% or less. This created a challenge to redeploy the vehicle rapidly between consecutive patrol shifts.
  - While the on-campus Tesla charging stations were adequate for the Pilot Program, a Supercharger would be preferable to reduce the amount of time needed to redeploy the vehicle after the conclusion of a patrol shift.
- Police equipment storage was adequate in the Tesla Model S 85; however, a larger rear space would be preferred to allow for "trunk organizers" to be placed in a single location. The Tesla Model S 85 utilized the front and rear areas to accomplish storage needs which was not an ideal configuration.
- The rear seat (prisoner barrier) in the Tesla Model S 85 posed a challenge for larger prisoners due to the limited space.

## RECOMMENDATIONS AND FUTURE PLANS

Though data garnered from the Electric Patrol Vehicle Pilot Program, the Fremont Police Department has concluded that it was a success and provided significant evidence that expansion of electric patrol vehicles is a feasible option.

Further, TCO calculations that were derived from the 388 City vehicles studied<sup>5</sup> indicated that EV replacement results in \$3,156,000 of savings to the City over the next 20 years, with \$2,457,000 of these savings directly related to Police vehicle replacement. Additionally, data from the City's current inventory of non-electric vehicles' greenhouse gas (GHG) emissions demonstrated that electrifying the fleet could reduce its GHG impact by 53% by 2030.

In determining the next EV to purchase, the FPD analyzed both the benefits and challenges that have been experienced with the Tesla Model S 85. Though the Tesla Model S 85 is cost-effective, energy-efficient, and a superior patrol vehicle when compared to gas vehicles, it lacks space for larger drivers and passengers, as well as sufficient rear storage for police gear.

Recently, various other car manufacturers have made significant progress in EV technology. For example, in 2021, Ford will be producing a vehicle with similar performance and specifications as the Tesla Model S 85. However, as it stands, Tesla currently remains the leading manufacturer that meets the needs of Fremont's policing environment.

To date, the FPD has already acquired two out of the three additional electric/hybrid patrol vehicles it has budgeted for the last two fiscal years: the 2020 Tesla Model Y (purchased for \$57,126.83<sup>6</sup>) and the 2021 Ford Utility Hybrid PPV (purchased for \$48,223). The third vehicle has not been purchased yet, as the City is considering a variety of car manufacturers and vehicle options prior to moving forward with this investment.

---

<sup>5</sup> City of Fremont Municipal Fleet Electrification Study May 2020

<sup>6</sup> Tesla and City of Fremont Motor Vehicle Purchase Agreement on July 20, 2020

The Tesla Model Y was identified as a vehicle that most closely satisfied its deployment needs and addressed many of the challenges noted in the assessment of the Tesla Model S 85 vehicle tested in the Pilot Program.

Benefits of the Tesla Model Y include:

- Lower starting price
- Crossover SUV similar to current police vehicle SUV platforms
- More rear cargo and storage for police equipment
- Increased range of over 300 miles
- Overall performance similar to Tesla Model S 85
- Added front entry/exit space enhancing driver comfort
- Higher ground clearance allowing vehicle to traverse a wide variety to terrain

Additionally, seven 2020 Ford Utility Hybrid PPVs and seven more 2021 Ford Utility Hybrid PPVs are being added to the FPD fleet to replace existing patrol vehicles that are at the end of their lifespan, funded by the City's overall vehicle replacement budget.

The City is evaluating the feasibility of a larger scale replacement of fleet vehicles with EVs over the coming years via the Municipal Fleet Electrification study cited earlier in this report<sup>7</sup>. This study, funded through a Bay Area Air Quality Management District Climate Protection grant, identifies upfront costs, long terms savings, GHG emissions reductions calculations, and EV charging infrastructure needs associated with an EV fleet and provides recommendations to the City on possible next steps. The project team has developed a website, <https://evfleet.tools/>, to share resources for other public agencies wishing to conduct a similar analysis.

Looking to the future, 23 dual port level 2 chargers and 1 direct current (DC) fast charger are projected to be needed at the Fremont Police Department complex to accommodate long-term fleet vehicle electrification into 2023 and beyond.

---

<sup>7</sup> City of Fremont Municipal Fleet Electrification Study May 2020

While the added cost of EV charging infrastructure was not included in the vehicle TCO, it will be considered as a separate infrastructure upgrade cost.

The study is now further evaluating options for EV charging infrastructure, including what costs would be for transitioning EV charging infrastructure to existing or new onsite solar photovoltaic systems and adding battery energy storage options. Funding for charging infrastructure is being evaluated as well, such as grants that would support its expansion within the FPD campus.

## APPENDIX

### The History of the Fremont Automobile Industry and the Fremont Police Department's Green Energy Initiative Timeline

- 1962 – The General Motors Fremont Assembly line is built.
- 1997 – The Fremont Police Department (FPD) begins to patrol using the Crown Victoria.
- 2009 – The FPD purchases two Ford Escape Hybrid vehicles and five 2009 Toyota Prius vehicles.
- 2010 – The GM Fremont Assembly line closes; Tesla Motors announces they had purchased part of the GM plant.
- 2011 – The FPD deploys nine Ford Escape Hybrids for CSO fleet; FPD discontinues use of the Crown Victoria.
- 2012 – The City of Fremont begins to implement the Climate Action Plan with the goal of reaching 25% greenhouse gas emission reductions from a 2005 baseline by the year 2020.
- 2016 – The FPD deploys five Ford Fusion Hybrids for command staff and admin Lieutenants.
- 2017 – The FPD purchases and deploys two additional Ford Fusion Hybrid Plug-Ins.
- 2018 – The FPD purchases and deploys one additional Ford Fusion Hybrid Plug-Ins for command staff; All Chief, Captains, and Administrative Lieutenants are driving hybrid vehicles; Tesla vehicle purchased.
- 2019 – The 2014 Tesla Model S 85 begins to patrol along with the 2019 Ford Fusion Police Responder PPV.
- 2020 – The Fremont Police Department shares findings from the nation's first Electric Patrol Vehicle Pilot Program.

### The Fremont Police Department's Current Hybrid Fleet

- 9 Ford Escape Hybrids for Community Service Officers
- 9 Ford Fusion Hybrids for Admin Lieutenants
- 3 Ford Fusion Hybrid Plug-Ins for Chief and Captains
- 5 Toyota Prius Vehicles for Admin assignments
- 1 2019 Fusion Hybrid Responder PPV
- 1 Tesla Model S 85

- 1 Tesla Model Y
- 7 2020 Ford Utility Hybrid PPVs
- 8 2021 Ford Utility Hybrid PPVs

### Additional Sustainability Facts from the Fremont Police Department

- The City's General Plan vision is for Fremont to serve as a national model of how an auto-oriented suburb can evolve into a sustainable, strategically urban, modern city.
- The City's Robert Wasserman Police Complex has 872 kW of solar carport structures installed onsite, providing clean and renewable electricity to the facility and to the electric vehicle as well as saving the City money on its electricity and vehicle operation bills.
- With all of Fremont's electricity supply coming from either onsite renewable solar power or 100% carbon-free, grid-based electricity through East Bay Community Energy (EBCE), each police vehicle that is replaced with an EV will completely zero out the greenhouse gas emissions associated with that vehicle's operation.

# FREMONT POLICE DEPARTMENT

## ELECTRIC VEHICLE PILOT PROGRAM

### THE PROGRAM

#### SEPTEMBER 2021 UPDATES

In 2019, Fremont Police Department (FPD) deployed its first fully electric-powered vehicle (EV) as part of its patrol fleet. After a year of data collection, results found that the pilot vehicle, a used 2014 Tesla Model S 85, exceeded performance and operational objectives, withstood the rigors of police use required minimal maintenance, and was cost-effective when factoring in the overall cost of the vehicle with maintenance and fuel savings. To date, FPD has acquired one additional fully electric patrol vehicle, a new 2020 Tesla Model Y, deploying in September 2021.

### VEHICLE COMPARISON

**2014 TESLA MODEL S 85**

- RWD
- 85 kWh battery
- 265 miles range (EPA)
- 5.4 seconds 0-60 mph
- Mileage when acquired: 26,471
- Selling Price: \$55,800
- Cost inc. tax & fees: \$61,478.50
- Purchase Invoice Paid: Dec 2017
- Possession Date: Jan 2018

**2020 TESLA MODEL Y**

- Long Range AWD, dual motors
- 74 kWh battery
- 316 miles range (EPA)
- 4.8 seconds 0-60 mph
- Mileage when acquired: N/A
- Selling Price: \$52,290
- Total Cost inc. tax & fees: \$57,126.83
- Purchase Invoice Paid: July 2020
- Possession Date: July 2020

### MODIFICATIONS MADE TO BOTH VEHICLES

- Overhead light-bar and siren
- Headlight and rear flashers
- Equipment console and electronics tray
- Mobile digital computer and mounting system
- Police vehicle radio
- Vehicle camera
- Push-bumper
- Prisoner partition
- Prisoner seat
- Ballistic door panels for driver and front passenger doors
- Trunk lights
- Driver & passenger spotlights (Model Y only)
- Pushbar spotlight and wheel well lights (Model S 85 only)

# FREMONT POLICE DEPARTMENT

## ELECTRIC VEHICLE PILOT PROGRAM

### PROGRAM RECAP

- The results from the one-year Electric Patrol Vehicle Pilot Program are encouraging as the City of Fremont continues to look for cost-effective ways to help make Fremont more sustainable and achieve long-term carbon neutrality by 2045.
- The Tesla Model S 85 yielded an average of 27 fewer days of downtime per year, a savings of \$2,147 in the total annual cost of energy/fuel, maintenance, and repair, and a reduction of 42,198 lbs. of operational carbon dioxide emissions. These results have prompted Fremont PD to move forward with plans to expand its fleet of electric patrol vehicle alternatives, including the newly deployed Tesla Model Y. For the coming fiscal year, FPD ordered three 2022 Ford Explorer hybrids as well as two Ford Mustang Mach-E EVs to be used as unmarked vehicles for sworn administrative assignments.
- This year, FPD added one additional charger to accommodate the new Model Y. Looking to the future, 23 dual port level 2 chargers and 1 direct current (DC) fast charger are projected to be needed at the Fremont Police Department complex to accommodate long-term fleet vehicle electrification into 2023 and beyond.
- To download the report and find additional information about the Tesla pilot project, visit [fremontpolice.gov/ElectricVehicle](https://fremontpolice.gov/ElectricVehicle)

## **South Pasadena Climate Action Plan**

Due to file size, the Executive Summary is attached in this report, and the full South Pasadena Climate Action Plan can be viewed here: <http://southpasadenacap.rinconconsultants.com>

# South Pasadena CAP Executive Summary

## Climate Action Vision

The effects of climate change are already felt and are projected to worsen over the next century without a concerted global effort to address the sources of greenhouse gas (GHG) emissions. South Pasadena's Climate Action Plan (CAP) details a set of strategies for South Pasadena to reduce its emissions, prepare for and mitigate approaching risks, and chart the course towards a sustainable future. Key components of that future include:

- ✓ **Vibrant Communities**
- ✓ **Engaged Citizens**
- ✓ **Social Equity**
- ✓ **Resilient Economy**
- ✓ **Environmental Stewardship**
- ✓ **Regional Leader in Sustainability**

## Background

The CAP is a long-range planning document that guides the City towards long-term

emissions reductions in accordance with State of California goals. The CAP analyzes emission sources within the City, forecasts future emissions, and establishes emission reduction targets (See The Playing Field and Appendix C). This CAP is the City of South Pasadena's roadmap to achieving the City's 2030 target and state mandated goal of 40% below 1990 levels by 2030 and demonstrates substantial progress towards achieving carbon neutrality by 2045. The CAP also establishes a framework for implementation and monitoring of reduction activities, and further promotes adaptation and preparedness actions. This CAP has been developed as a qualified GHG Reduction Plan and meets the requirements of CEQA 15183.5(b).

### Potential Impacts to the Community

The City of South Pasadena may experience a variety of impacts due to climate change including an increase in average temperature and changes in precipitation, as outlined in Figure 1

Figure 1 Impacts of Climate Change in the City of South Pasadena (~2100)

**Figure 2 2016 Community-wide Emissions Summary by Sector**

## Baseline GHG Emissions

This CAP includes a 2016 baseline inventory of GHG emissions from municipal operations and community-wide activities within the City. It is important to note that the municipal operations inventory is a subset of the community inventory, meaning that the municipal emissions are included within the community-wide inventory. See Figure 2 for a per sector community emissions summary.

## Emissions Forecast

Emissions forecasts (what we predict GHG emissions to be in the future) are generated from the 2016 baseline inventory to help identify actions that must be taken now in order to meet future targets. This CAP identifies GHG emissions reduction targets for the years 2020 (AB 32 target year), 2030 (SB 32 target year), 2040 (City of South Pasadena’s General Plan horizon year), and 2045 (EO B-55-18 target year).

## Emissions Targets

After analyzing the City’s baseline inventory and forecast scenarios, emission targets were set to create quantitative goals that will further the City’s ability to measure emission reduction progress from the baseline scenarios. The 2016 baseline emissions were reduced by 40 percent to establish a 2030 target of 75,161 MT CO<sub>2</sub>e for the City. In

accordance with the new California Air Resource Board (CARB) methodology and the statewide goal established in SB 32, this absolute emissions target was then translated into a 2030 per capita emission target of 2.9 MT CO<sub>2</sub>e per year by dividing the 2030 absolute target by South Pasadena’s projected population in 2030.

As shown in Figure 3, South Pasadena would require implementing local reduction measures to meet the state targets established for 2030 and 2045 even after accounting for reductions that will result from state regulations.

## Reducing Emissions in South Pasadena

At its core, the CAP aims to reduce GHG emissions in the City through equitable, achievable, and implementable actions that benefit all South Pasadenans. The Plays (measures) and Moves (actions) included in the CAP were established and refined to meet the City’s GHG emission reduction target for 2030 and provide substantial progress towards meeting the longer-term target of carbon neutrality by 2045, which align with the state’s goals and is the City’s fair share towards achieving the state’s overall climate goals (see Table 1 for a summary of the Plays included in the CAP).

**Figure 3 Community Emissions, Targets, and Reductions Needed to Meet Targets**

### Cornerstones of Climate Action Planning

The City of South Pasadena acknowledges that long-term sustainable change must occur to reduce our GHG emissions and limit our impact on climate change. This change will come from a collective commitment to reduce emissions through implementation of effective and equitable emission reduction strategies, such as the Plays and Moves outlined in this CAP. High-quality climate action planning is built on six essential components that result in implementable and effective GHG emission reduction strategies.

These six essential components, **education, structural change, GHG reductions, equity, connectivity, and economical design**, are the cornerstones that lay the foundation for transformational change and are essential to engage the community and fulfill the emissions reductions goals laid out in the Plan.

South Pasadena’s CAP includes 15 specific Plays designed to reduce GHG emissions associated with Energy, Transportation, Water, Waste, Sequestration, and Municipal Operations. Each Play is supported by Moves that were designed to incorporate the cornerstone components of climate action planning and create unique solutions to climate change, which are summarized in Table 1.

**Table 1 Emission Reduction Plays and Moves Summary**

Sector	Play	GHG Emissions Reduction Contribution
Cornerstone	C.1	Engage South Pasadena youth in climate change action and provide education on ways to live a sustainable lifestyle. 2030: 25 MT CO <sub>2</sub> e 2045: 78 MT CO <sub>2</sub> e
Energy	E.1	Maximize the usage of renewable power within the community, by continuing to achieve an opt-out rate lower than 4% for the Clean Power Alliance. 2030: 13,408 MT CO <sub>2</sub> e 2045: 0 MT CO <sub>2</sub> e
	E.2	Require electrification of 100% of newly constructed buildings. 2030: 240 MT CO <sub>2</sub> e 2045: 984 MT CO <sub>2</sub> e
	E.3	Electrify 5% of existing buildings by 2030 and 80% by 2045. 2030: 1,184 MT CO <sub>2</sub> e 2045: 19,355 MT CO <sub>2</sub> e
	E.4	Develop and promote reduced reliance on natural gas through increased clean energy systems that build off of renewable energy development, production, and storage. Supportive of 2030 and 2045 Goals
Transportation	T.1	Increase use of zero-emission vehicle and equipment 13% by 2030 and 25% by 2045. 2030: 3,774 MT CO <sub>2</sub> e 2045: 6,629 MT CO <sub>2</sub> e
	T.2	Implement programs for public and shared transit that decrease passenger car vehicle miles traveled 2% by 2030 and 4% by 2045. 2030: 807 MT CO <sub>2</sub> e 2045: 1,399 MT CO <sub>2</sub> e
	T.3	Develop and implement an Active Transportation Plan to shift 3% of passenger car vehicle miles traveled to active transportation by 2030, and 6% by 2045. 2030: 1,186 MT CO <sub>2</sub> e 2045: 2,015 MT CO <sub>2</sub> e
Water and Wastewater	W.1	Reduce per capita water consumption by 10% by 2030 and 35% by 2045. 2030: 414 MT CO <sub>2</sub> e 2045: 0 MT CO <sub>2</sub> e
Solid Waste	SW.1	Implement and enforce SB 1383 organics and recycling requirements to reduce landfilled organics waste emissions 50% by 2022 and 75% by 2025. 2030: 1,702 MT CO <sub>2</sub> e 2045: 1,764 MT CO <sub>2</sub> e
	SW.2	Reduce residential and commercial waste sent to landfills by 50% by 2030 and 100% by 2045. 2030: 415 MT CO <sub>2</sub> e 2045: 859 MT CO <sub>2</sub> e
Carbon Sequestration	CS.1	Increase carbon sequestration through increased tree planting and green space. 2030: 19 MT CO <sub>2</sub> e 2045: 39 MT CO <sub>2</sub> e
Municipal	M.1	Reduce carbon intensity of City operations. 2030: 188 MT CO <sub>2</sub> e 2045: 188 MT CO <sub>2</sub> e
	M.2	Electrify the municipal vehicle fleet and mobile equipment. 2030: 23 MT CO <sub>2</sub> e 2045: 23 MT CO <sub>2</sub> e
	M.3	Increase City's renewable energy production and energy resilience. Supportive of 2030 and 2045 Goals
<b>Total</b>		<b>2030: 23,386 MT CO<sub>2</sub>e</b> <b>2045: 33,333 MT CO<sub>2</sub>e</b>

Note: South Pasadena would be required to reduce 18,578 MT CO<sub>2</sub>e by 2030, 53,874 MT CO<sub>2</sub>e by 2040, and 73,969 MT CO<sub>2</sub>e by 2045 to meet the City's targets and state goals.

**ATTACHMENT D**  
Tesla 2020 Impact Report

# Impact Report 2020

T E S L A

## Introduction

### Focusing on What Matters

The very purpose of Tesla's existence is to accelerate the world's transition to sustainable energy.

The objective of an Environmental, Social and Governance (ESG) impact report is to disclose the impact a company has on those three areas, as well as to present, to the extent possible, data and other information qualifying and quantifying that impact.

At Tesla, we strive to be the best on every metric relevant to our mission to accelerate the world's transition to sustainable energy. In order to maximize our impact, we plan to continue increasing our production volumes and the accessibility of our products. In more concrete terms, this means that by 2030 we are aiming to sell 20 million electric vehicles per year (compared to 0.5 million in 2020) as well as to deploy 1,500 GWh of energy storage per year (compared to 3 GWh in 2020).

If we were to achieve such a vehicle delivery milestone through a consistent growth rate, the total Tesla vehicle fleet would surpass tens of millions of vehicles by 2030 and each of those vehicles could save tons of CO<sub>2</sub> from being emitted every year of usage.

Furthermore, each product we make must be continuously improved at each step of its lifecycle: from manufacturing to consumer use to recycling. We must also improve every metric, including the energy and water used to make our products, how safe our customers and employees are and the

affordability and accessibility of our products. All these themes will be covered in this year's Impact Report.

Tesla aspires to do the right thing, and we are constantly looking for ways to do better. If you have suggestions about how our company can improve in any way, feel free to send your ideas to [impactreport@tesla.com](mailto:impactreport@tesla.com).

Finally, it is important to note that current ESG evaluation methodologies tend to use a generic template to analyze every manufacturing company's carbon footprint. Vehicle use phase, which realistically accounts for 80-90% of total automotive emissions (included in Scope 3 of ESG reporting) is repeatedly underreported. As use phase reporting guidelines remain vague, OEMs often use unrealistic assumptions for lifetime mileage and unrealistic fuel consumption figures rather than real-world figures. As a result, it is not uncommon for the carbon footprint of the use phase to be underreported by up to 50%.

Our estimates in this report use real-world mileage and real-world energy consumption data sourced from our fleet of over one million cars on the road to calculate greenhouse gas (GHG) savings. We believe that reporting use phase emissions based on real-world fleet data should become an ESG standard.

## Materiality Analysis

We conducted our first-ever materiality analysis, the results of which identified key areas that our stakeholders said they cared about and are reflected in the content of this year's Impact Report.

To conduct the materiality analysis, we surveyed key stakeholders for Tesla, including Tesla's Board of Directors, operational leadership, employees, suppliers, investors and customers, as well as state and local policymakers, to understand which ESG topics these groups find most relevant to our business. Environmental impact is a front-and-center theme for stakeholders, who are advocating for emissions reductions in both our manufacturing processes and the charging of Tesla vehicles.

Our stakeholders also want us to use industry best practices in a variety of ways - from human rights, to mining and recycling, to vehicle capacity expansion and new factory construction.

Our discussions of each of these themes are listed in our Table of Contents on the next page, and we dive into the details throughout this report. More information about our materiality survey can be found on page 84.

## **Summary** 81

## **Appendix** 84

In 2020, the global fleet of Tesla vehicles and solar panels enabled our customers to avoid emitting 5.0 million metric tons of CO<sub>2</sub>e

The 3.5 million metric tons of vehicle CO<sub>2</sub>e savings estimate is based on the net CO<sub>2</sub>e savings during the use phase of a Tesla vehicle compared to an ICE vehicle with a real-world fuel economy of ~25 mpg. The 1.5 million metric tons of solar CO<sub>2</sub>e savings estimate is based on CO<sub>2</sub>e avoided through generation of zero-emission electricity from Tesla solar panels. Distribution of our deliveries (both vehicle and solar), grid mix at the country, state and province level and upstream emissions are reflected in these figures.

# Measuring What Matters

Tesla vehicles' all-in emissions per mile are significantly lower than ICE vehicles'

Capacity retention of Tesla vehicle batteries averages ~90% after 200,000 miles of usage

Our upcoming factories will set a new standard for low energy and water usage per vehicle

Global energy generation from Tesla-installed solar panels far outpaces our total energy use

Commodities we use are sourced responsibly and as locally as possible

## Driven by Sustainability Mission and Tesla Ecosystem

Sustainability drives us at Tesla. And not just our products—it drives our values and mission as a company. It's at the core of everything we do and is what motivates us in our work. It also matters greatly to our customers, employees and shareholders. Our products and services are focused on transportation and energy production and storage—traditionally some of the biggest polluters both in the U.S. and globally.

To achieve a zero-emissions future, we have implemented several programs and initiatives at our global manufacturing facilities and in the communities in which we operate. These programs provide clean energy to local schools, nonprofits and everything in between.

# Driven by Sustainability

## Mission and Tesla Ecosystem

### Addressing climate change through an entire ecosystem

Climate change is reaching alarming levels globally due in large part to emissions from burning fossil fuels for transportation and electricity generation. The world cannot reduce CO<sub>2</sub> emissions without addressing both energy generation and consumption. And the world cannot address its energy habits without first directly reducing emissions in the transportation and energy sectors.

We are designing and manufacturing a complete energy and transportation ecosystem. We not only develop the technology behind this ecosystem, but we also focus heavily on the affordability of our products that comprise it. We seek to achieve this through our R&D and software development efforts as well as through our continuous drive to develop advanced manufacturing capabilities. This is not only the right thing to do, but it also makes economic sense.

## Driven by Sustainability Management and Oversight

### Management involvement

Our ESG Sustainability Council, made up of leaders from across Tesla, collects data and prepares the analysis and content of this report. The Sustainability Council also regularly presents this information to Tesla's Board of Directors for review.

### Board of Directors oversight

The Board of Directors serves as a prudent fiduciary for shareholders and oversees the management of Tesla's business – including oversight of Tesla's ESG impacts, initiatives and priorities. With those responsibilities in mind, the Board sets high standards for Tesla and its employees, officers and directors. Implicit in this approach is the importance of sound corporate governance.

# Environmental Impact

## Introduction

### 5,340 miles

The manufacturing process of a Model 3 currently results in slightly higher GHG emissions than an equivalent combustion engine vehicle. However, based on the global weighted average grid mix, a Model 3 has lower lifetime emissions than an equivalent ICE after driving 5,340 miles.

In this section of the Impact Report, we will go over the details and calculations of the lifetime environmental impact of our products.

**Our lifecycle analysis (LCA) combines Scope 1 and 2, and material Scope 3 emissions\* for a Fremont-made Model 3**

While we are implementing processes to be able to measure and report Scope 1, 2 and 3 emissions on an enterprise level starting with our 2021 report, for the purpose of this report, we have conducted an LCA which includes the vast majority of Scope 1, 2 and 3 emissions, including the vehicle manufacturing phase, emissions from our supply chain, vehicle use and end-of-life for a Fremont-made Model 3. While not a perfect measure, given the importance of the Model 3 and its high volume of deliveries since 2018, it is a good proxy for understanding the emissions impact of our vehicle business. The details and boundaries of this LCA analysis are described on page 90. Our goal is to eventually produce an LCA for each of our products in addition to reporting our Scope 1, 2 and 3 emissions.

**EVs undeniably generate less lifetime greenhouse gas emissions than ICE vehicles**

We are often asked if electric vehicles (EVs) are more sustainable than internal combustion engine (ICE) vehicles. The environmental impact of zero-emission transport and energy products, like the products that Tesla produces and sells, is undeniably more positive than the GHG-emitting alternatives. This becomes more pronounced when determining the lifetime impact of EVs versus ICE vehicles, which requires looking at the entire lifecycle—from raw materials to use phase emissions to disposal—and not just at vehicle usage emissions.

**Variables often overlooked by other lifecycle studies:**

- Using Worldwide Harmonized Light Vehicle Test Procedure (WLTP) or Environmental Protection Agency (EPA) fuel/energy consumption data (both of which overestimate fuel-economy and underestimate emissions) rather than real-world data;
- Not considering the higher energy efficiency of Tesla's powertrains;
- Assuming the average EV needs a battery replacement at some point in its life;
- Not considering emissions generated through the oil refining and the transportation process; and
- Using outdated data for the carbon impact of cell manufacturing.

We try to address these considerations and complexities in deriving a more accurate calculation in the following lifecycle analysis.

\*For a definition of Scope 1, 2 and 3 emissions see page 90 of this report.

## Lifecycle Analysis of Tesla EVs vs. Equivalent ICE Vehicles

# 69 tons

Lifetime CO<sub>2</sub>e emitted by an average internal combustion engine vehicle (model year 2020) sold in the U.S. through its use phase, excluding CO<sub>2</sub>e emitted during the oil refining phase.

Using only real-world data, not official NEDC, WLPT or EPA\* consumption data

The most important variable in a lifecycle analysis of an automobile is real-world fuel consumption or electricity consumption, as applicable, which impacts the use phase of the lifecycle. Various efficiency testing cycles such as NEDC, WLTP or EPA do not truly represent real-world fuel or energy consumption. Therefore, for the purpose of this analysis, we used average energy consumption over the more than 10 billion miles Tesla Model 3s have travelled as of December 31, 2020, including energy losses during the charging process. For ICE vehicles, we used real-world fuel consumption data provided by Consumer Reports, which reports model year 2020 mid-size premium sedans achieve 24.8 MPG on average. This translates to ~400 grams of CO<sub>2</sub> per mile once we account for emissions generated through the extraction, refining and shipment of oil.

The carbon impact of ICE vehicles remains the same every year of use, but for EVs, it should improve every year

Based on publicly available sales and fleet data, we estimate that an average vehicle in the U.S. is driven slightly less than 12,000 miles per year for about 17 years before it is scrapped. Furthermore, as an ICE vehicle ages, its fuel efficiency only remains stable if serviced properly. On the other hand, electricity generation to charge EVs has become “greener” over time with the addition of cleaner energy sources to the grid. Thus, emissions generated through EV charging should continue to decline over time.

On the following pages, we will show the per mile lifecycle emissions of a current Fremont-made Model 3

This includes emissions from upstream supply chain, direct emissions from manufacturing and electricity consumption, and use phase emissions when charged from a grid with a generation mix that reflects the geographic distribution of Model 3 deliveries in each of the U.S., Europe and China. Below are the lifecycle emissions scenarios we show, and the assumptions used in each of the charts on the following pages:

- What emissions per mile could be if a Model 3 were used for ridesharing over one million miles using cell chemistry from Tesla energy products.
- What emissions per mile could be if a Model 3 were principally charged at home using a solar system and energy storage.
- What emissions per mile could be if a Model 3 were used for ridesharing over one million miles using cell chemistry from our energy products and if it were only charged using a solar system and energy storage.
- The reference ICE vehicle is based on the average mid-size premium sedan in the U.S.
- Charging a Model 3 using solar panels and a Powerwall adds emissions to the manufacturing phase while reducing use phase emissions to as low as zero when 100% of charging is done using that system.
- We assume no additional renewable energy capacity on the grid during the life of the vehicle given the shape of the renewable energy adoption curve is still very much up for debate.

# EV vs. ICE Vehicle Emissions per Mile

## United States

The electricity grid keeps getting cleaner, while emissions from ICE vehicles do not

While the makeup of the electricity grid varies from region to region, charging EVs is becoming less carbon intensive every year. In the U.S., coal has historically been the dominant energy source for generating electricity. However, in the last decade, coal power has declined significantly as regions turn to cleaner energy sources, such as wind and solar. Energy generated by renewable sources has grown rapidly—in 2021, wind, solar and battery storage are expected to account for an estimated 81% of new electricity generation capacity in the U.S. Many U.S. states (such as New York, referenced in the chart below) have been making significant investments in renewable energy, as these sustainable options become more cost competitive compared to fossil fuel resources.

To put this in perspective, average GHG emissions from charging one New York-based Tesla vehicle equates to the emissions from an ICE vehicle with a fuel economy of 135 MPG (no such vehicle is on the market). Even when charging a Tesla in Michigan, where approximately 60% of energy comes from natural gas and coal, the emissions from our vehicles still equates to the emissions from an ICE vehicle with 59 real-world MPG (considerably more in terms of EPA rated MPG). As more regions adopt sustainable energy solutions to generate power, emissions related to charging an EV from the grid will decrease even further.

EV customers can increase their renewable energy mix by installing solar panels or a Solar Roof and an energy storage solution, such as Powerwall, in their homes. This dramatically reduces the lifetime carbon footprint of an EV, even when accounting for the carbon footprint of both the solar panel/Solar Roof and Powerwall manufacturing and upstream supply chain.

Average Lifecycle Emissions in U.S. (gCO<sub>2</sub>e/mi)\*

Average Lifecycle Emissions in New York State (gCO<sub>2</sub>e/mi)

\*gCO<sub>2</sub>e/mi = grams of CO<sub>2</sub>-equivalent per mile driven

# EV vs. ICE Vehicle Emissions per Mile

## European Union, U.K. & EFTA

A cleaner grid in Europe means a bigger emissions gap between Model 3 and a comparable ICE vehicle

In Europe, the U.K. and EFTA (Iceland, Liechtenstein, Norway and Switzerland), larger portions of energy generation come from either renewable sources or nuclear, which means that in Europe the use phase emissions gap between ICEs and EVs is even wider than it is in the U.S.

On the other hand, since an average European driver covers fewer miles per year than a U.S. driver, emissions from the manufacturing phase are divided by fewer miles. While in the U.S., an average vehicle covers 200,000 miles before getting scrapped, in Europe, total mileage is closer to 150,000 miles.

We used Austria as an example of how use phase emissions should evolve once the European grid becomes greener. As seen in the chart on the right, in Austria, all-in lifecycle emissions of a personal, grid-charged Model 3 are more than 4x lower than all-in lifecycle emissions of an equivalent ICE vehicle.

# EV vs. ICE Vehicle Emissions per Mile

## China

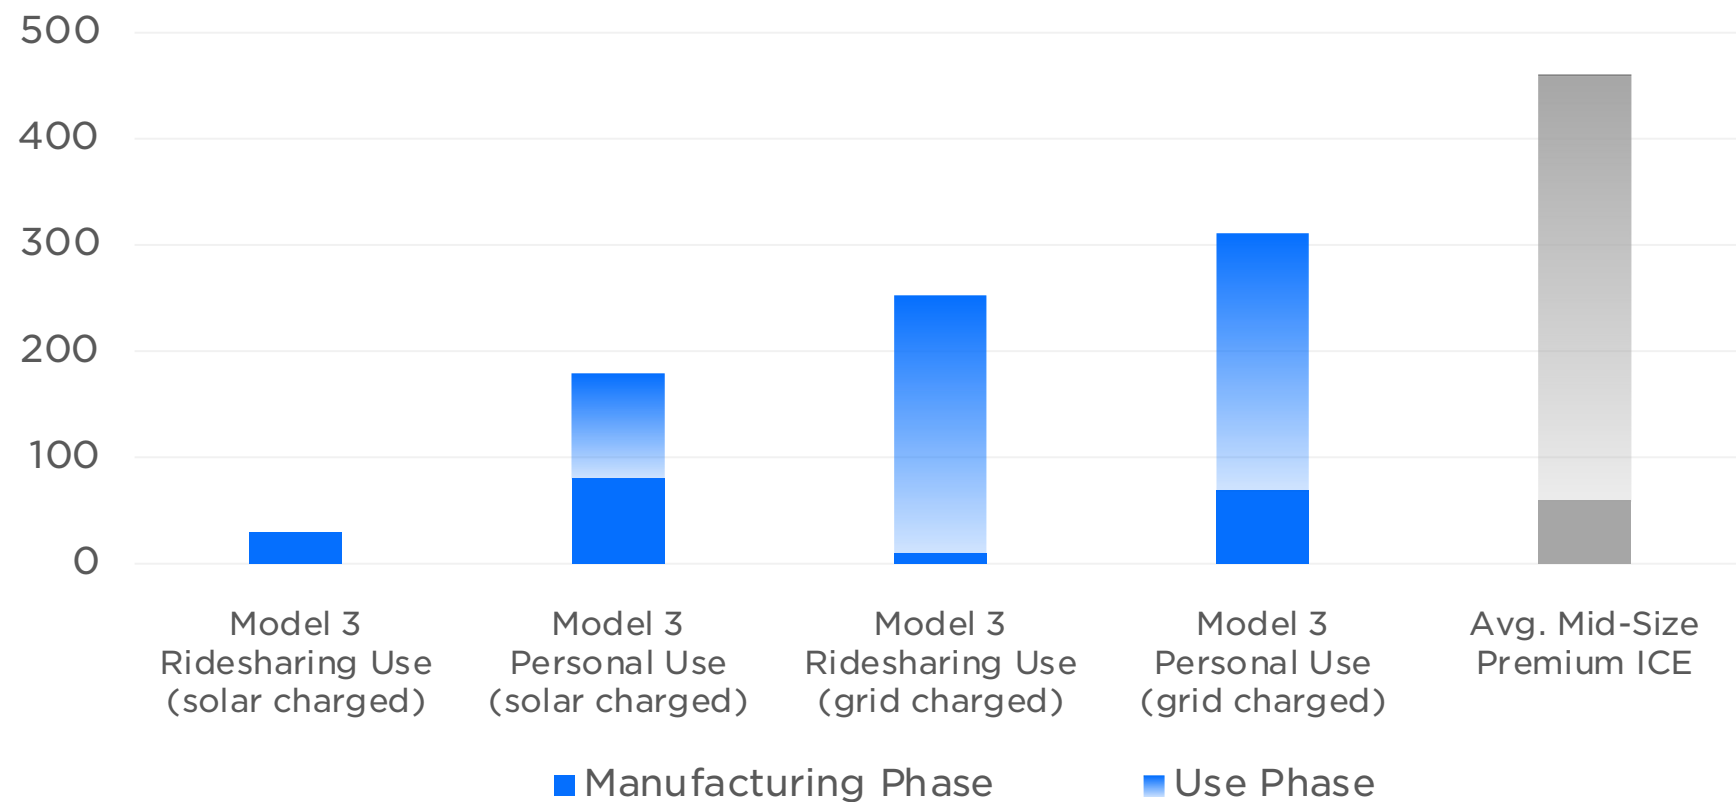

Despite a higher-emissions grid in China, Model 3 still has lower emissions than comparable ICE vehicles

In China, much of the grid is powered by coal. That said, even in this scenario, charging a Tesla Model 3 from the grid is still less emission intensive than running an ICE vehicle. Just like in Europe, we have assumed a vehicle lifetime of 150,000 miles.

We are expecting the grid mix in China to improve dramatically over time as China remains a dominant deployer and manufacturer of renewable energy. Sichuan Province (with a population of 81 million) is a great example of this. In this province, given the high percentage of renewable energy penetration, charging an EV from the grid is less polluting than charging an EV in most global countries or states.

In conclusion, even as of 2020, charging a Tesla Model 3 in any of our major markets is more environmentally friendly than burning gasoline. Considering that vehicles are used for 17 to 20 years before getting scrapped, it is reasonable to assume that in the coming years, the gap in emissions per mile between EVs and ICEs will only get wider.

Average Lifecycle Emissions in China (gCO<sub>2</sub>e/mi)

Average Lifecycle Emissions in Sichuan Province (gCO<sub>2</sub>e/mi)

## Reducing Carbon Footprint Even Further Improving Powertrain Efficiency

### Efficiency of a Prius, performance of a Porsche

Tesla vehicles are known to have the highest energy efficiency of any EV built to date. In the early days of Model S production, we were able to achieve energy efficiency of 3.1 EPA miles / kWh. Today, our most efficient Model 3 Standard Range Plus (SR+) achieves an EPA range of 5.1 miles / kWh, higher than any EV in production to date. Model Y all-wheel drive (AWD) achieves 4.2 EPA miles / kWh, which makes it the most efficient electric SUV produced to date. The gap between Tesla AWD vehicle efficiency continues to stand out compared to competitors in the same segment. While achieving the best-in-class energy efficiency, our AWD models can accelerate to 60 mph in just 3.7 seconds (4.2s for Model Y) and reach a top speed of 145 mph (135 mph for Model Y). In isolation, high energy efficiency is already difficult to achieve, but getting both performance and efficiency is the tricky part.

### Tesla Robotaxis will be even more energy efficient

The energy efficiency of Tesla vehicles will continue to improve over time as we continue to improve our technology and powertrain efficiency. It is also reasonable to assume that our high-mileage products, such as our future Tesla Robotaxis, will be designed for maximum energy efficiency as handling, acceleration and top speed become less relevant. This will minimize cost for our customers as well as reduce the carbon footprint per mile driven.

# Reducing Carbon Footprint Even Further

## Tesla Manufacturing Footprint: Current Actions

While emissions from the manufacturing phase can account for a relatively minor portion of lifetime vehicle emissions when compared to the use phase, it is still an important part of lifecycle emissions. These are the steps that we are taking to reduce the manufacturing GHG footprint:

### 1. Building new, better designed, more efficient vehicle factories

Building a factory from the ground up with sustainability in mind can have a material impact on reducing energy use. For each component that requires less movement around the factory, and as we use fewer robots in the vehicle production process, energy consumption declines.

Our Fremont Factory, where we started operation in 2010, was built over 60 years ago by established automotive original equipment manufacturers (OEM). While substantial improvements have been implemented since, it was not possible to fundamentally change the layout of this facility. In contrast, Tesla's newer factories are built by us from the ground up and designed to be sustainable and efficient. For example, a delivery truck can back up and offload components at the exact part of the production line where such components are needed—reducing emissions associated with the production process.

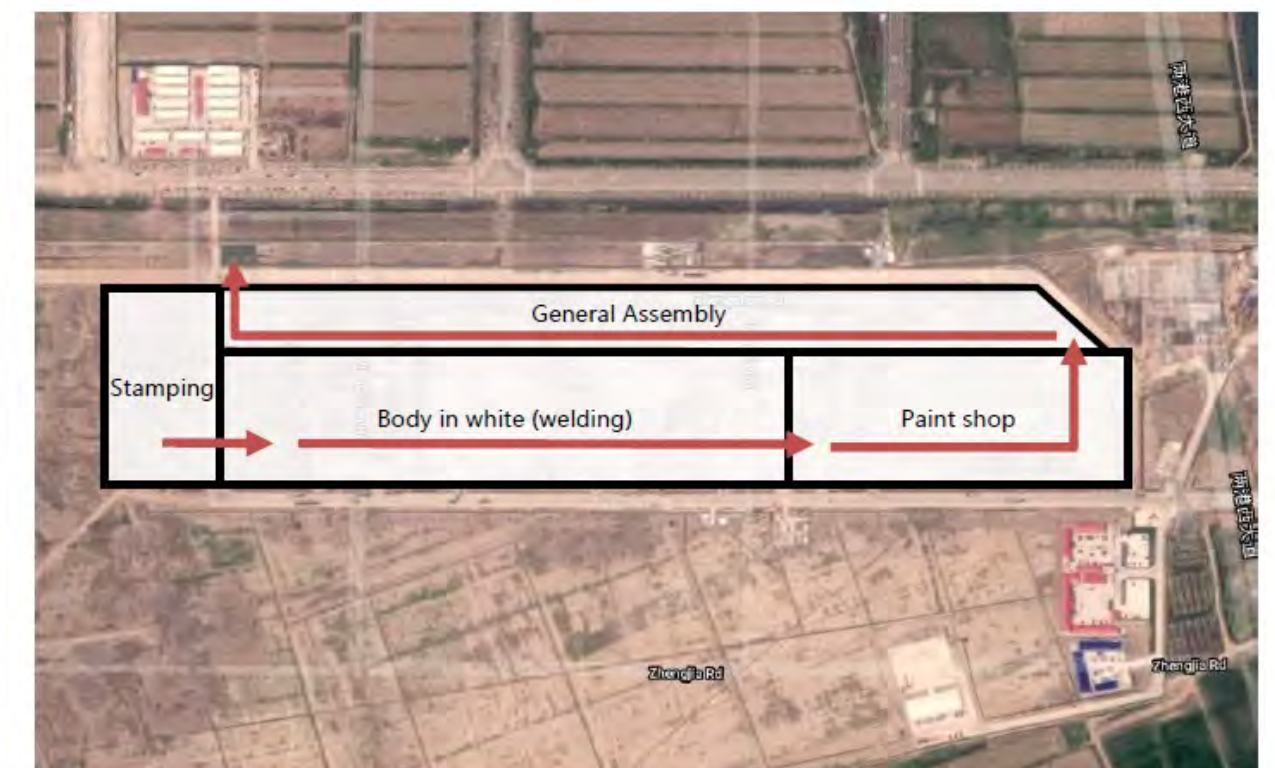

In our quest for constant improvement, we build each new factory to be better and more sustainably designed than the previous one. While we have already completed substantial improvements at Gigafactory Shanghai, further improvements will continue at Gigafactory Berlin-Brandenburg and Gigafactory Texas.

Model 3 in Fremont, CA

Model 3 in Gigafactory Shanghai

# Reducing Carbon Footprint Even Further

## Tesla Manufacturing Footprint: Current Actions

While emissions from the manufacturing phase can account for a relatively minor portion of lifetime vehicle emissions when compared to the use phase, it is still an important part of lifecycle emissions. These are the steps that we are taking to reduce the manufacturing GHG footprint:

### 2. Production localization

Prior to the end of 2019, all our vehicles were produced in a single location, California (with batteries and powertrains from Nevada), and shipped to the rest of the world. As Tesla's operating cash flows improved substantially (\$2.1B in 2018, \$2.4B in 2019 and \$5.9B in 2020), we were able to start global expansion of our vehicle manufacturing footprint. Since the vast majority of our demand comes from North America, Europe and China, we wanted to make sure we could produce and deliver vehicles locally from each of these locations.

- a) Fremont Factory + Gigafactory Nevada (open since 2017)
- b) Gigafactory Shanghai (open since 2019)
- c) Gigafactory Berlin-Brandenburg (will open in late 2021)
- d) Gigafactory Texas (will open in late 2021)

Former approach

New approach

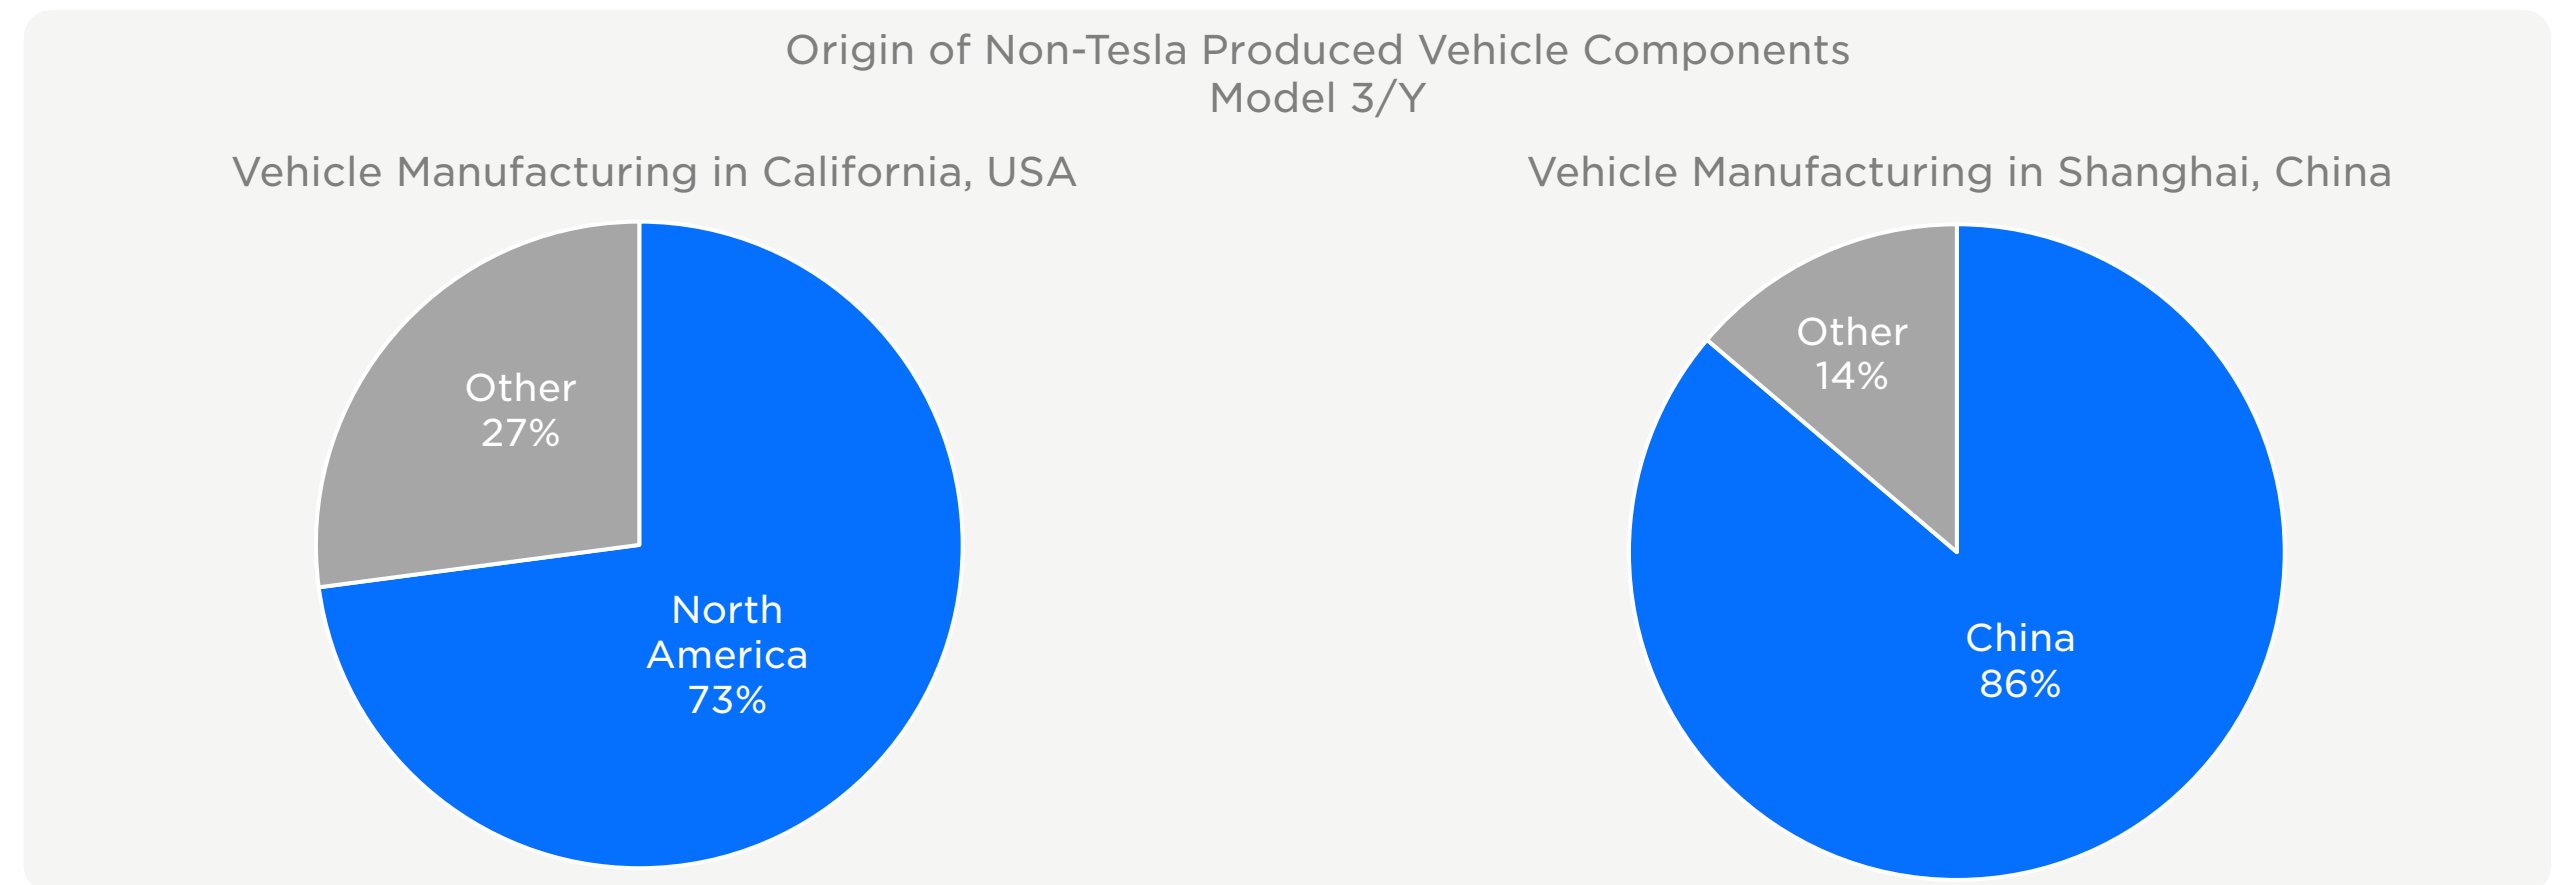

## Reducing Carbon Footprint Even Further Tesla Manufacturing Footprint: Current Actions

While emissions from the manufacturing phase can account for a relatively minor portion of lifetime vehicle emissions when compared to the use phase, it is still an important part of lifecycle emissions. These are the steps that we are taking to reduce the manufacturing GHG footprint:

### 3. Supply chain localization

In alignment with our mission, Tesla believes in reducing emissions upstream of our factories, including the carbon footprint of our supply chains. When it comes to subcomponent manufacturing, such as the instrument panel and large stamped portions of the vehicle body, we believe the closer they are manufactured to our factories, the better. Localizing suppliers reduces the distance parts need to travel before they are assembled into our vehicles, and reduces the emissions associated with transportation. Supplier localization also supports the local community and its workforce and reduces the risk of a supply disruption due to geopolitical dynamics. While some components (for example, semiconductors) are and will continue to be fabricated at highly specialized manufacturing facilities in specific locations around the globe, heavy vehicle parts will increasingly be produced near our Gigafactories in order to be closer to our vehicle manufacturing process.

As a testament to Tesla's localization efforts and our strategy to manufacture key modules, such as the battery pack, drive unit and seating in-house at Tesla, Tesla's Model 3 was recently awarded the top spot (Model Y was third) on the Cars.com American-Made Index. The index ranks vehicles using five factors: assembly location, parts content, engine (powertrain) origin, transmission origin and U.S. manufacturing workforce.

Component origin calculations are based on expenditures for non-Tesla produced Model 3 and Model Y vehicle components purchased in the fourth quarter of 2020. Location information is based on country-of-origin data as captured through Tesla's external supply base.

## Reducing Carbon Footprint Even Further Tesla Manufacturing Footprint: Current Actions

While emissions from the manufacturing phase can account for a relatively minor portion of lifetime vehicle emissions when compared to the use phase, it is still an important part of lifecycle emissions. These are the steps that we are taking to reduce the manufacturing GHG footprint:

### 4. Covering roof space with solar panels

Gigafactory Nevada was designed to be covered with solar panels. To date, we have installed solar panels with a capacity of 3,200 KW. This installation will grow to about 24,000 KW—the whole roof of the current building structure—by the end of next year. This will make it the largest rooftop solar installation in the U.S. We are installing solar panels at other locations, too, such as our Fremont Factory, Lathrop factory and Gigafactory New York.

## Reducing Carbon Footprint Even Further Tesla Manufacturing Footprint: Upcoming Plans

We will not be content until all of our factories become carbon neutral, and there are other projects that we are working on to further reduce emissions. In order to reduce the cost of our vehicles and batteries, we also need to use less energy to produce them. Many of the projects created to achieve this goal were showcased at our Battery Day presentation in September 2020.

### 5. Transitioning to in-house manufactured 4680 Tesla cells, whose production process can reduce energy consumption by 70%

At Tesla's 2020 Battery Day, we presented a novel way that cells can be manufactured using a dry electrode process. Current electrode production processes involve mixing liquids with cathode or anode powders and using massive machinery to coat and dry the electrode. Since this process involves large ovens, today's cell production consumes a lot of energy. The new dry-electrode process allows for the direct transition from a cathode or anode powder to an electrode film, reducing energy consumption in the overall cell manufacturing phase by at least 70% based on our latest analysis.

### 6. Transitioning to in-house cathode material manufacturing

While transitioning to in-house cathode materials should take longer than transitioning to in-house cells, our cathode materials manufacturing process has the potential to reduce energy use in this step of the process (currently undertaken by suppliers) by 40%.

### 7. Utilizing renewable energy as much as possible throughout all our operations

It is our intention to shift energy consumption toward renewable energy as quickly as possible throughout our operations, whether its at our factories, sales, service or delivery locations, or through our Supercharger Network.

## Reducing Carbon Footprint Even Further Increasing Vehicle Utilization

Our batteries are designed to function for the entire life of the vehicle

Tesla's battery packs are designed to outlast the vehicle. We estimate that a vehicle gets scrapped after approximately 200,000 miles of usage in the U.S. and roughly 150,000 miles in Europe. Creating a battery that could instead last for 1,000,000 miles (4,000 charging cycles) would dramatically reduce the emissions per mile driven for high-mileage vehicles such as taxis, delivery vans or trucks. This is clear when comparing the per mile emissions of a Model 3 for personal use versus ridesharing use - the per mile emissions from the use phase remain the same, but the emissions per mile from the manufacturing phase are substantially lower because the emissions are spread over many more miles.

Producing Robotaxis is a core part of our mission to accelerate the world's transition to sustainable energy

All vehicles in the world combined travel trillions of miles every year. A relatively small number of vehicles, such as taxis, delivery vans, trucks and buses account for a disproportionate amount of vehicle miles and, as a result, a disproportionate amount of emissions. A single future Tesla vehicle with a million-mile battery could be utilized over five-times more than an average vehicle in the U.S. After being fully optimized, and even once it is scrapped, a battery can still be recycled and its materials used in a brand-new battery.

## NOx, Particulates and Other Pollutants

Pollution in the Italian Alps prior to stay-at-home orders

Pollution in the Italian Alps during COVID-19 lockdowns

Pollution from burning fossil fuels leads to eight million premature deaths globally each year

According to recently published research in *Environmental Research* by Harvard University, in collaboration with the University of Birmingham, the University of Leicester and University College London, air pollution causes over eight million premature deaths annually. That is double the previous estimate of deaths from the negative effects of fine-particle pollution and would account for one-in-five premature deaths worldwide. This is a major advantage of EVs that is often forgotten about as the overall EV debate tends to focus on greenhouse gases. EVs are not just about the future of our planet, but very much about addressing preventable deaths today.

While air-quality is often categorized as a problem in developing countries, Nitrogen oxide (NOx) and other PM2.5 particulates\* cause significant issues in developed countries as well. In Europe alone, almost 800,000 people die prematurely every year due to pollution-related illnesses. EVs not only reduce the world's total carbon footprint, but also help to reduce city pollution.

Lockdowns have shown how clean cities could look

Cities around the world are gradually setting targets for banning diesel vehicles, which are known for their high NOx and particulate emissions. We have seen throughout the first half of 2020 that air quality can rapidly improve with the reduction of ICE-related traffic as the restrictions on business and travel due to COVID-19 led to dramatically fewer miles being driven. It is not hard to imagine that many cities could become electric-only in the near future as they were able to witness the positive impact that fewer ICE vehicles on the road has on air quality.

\*PM2.5 refers to atmospheric particulate matter (PM) that have a diameter of less than 2.5 micrometers and include combustion particles, organic compounds, metals, etc. Image: Flavio Lo Scalzo/Reuters

# Tesla Semi

## Reducing Fleetwide Emissions

Very few combination trucks are on the road, but account for 17% of total vehicle emissions

Combination trucks - of which the vast majority are semi trucks - in the U.S. account for just 1.1% of the total fleet of vehicles on the road. That said, because combination trucks have high fuel consumption due to their weight and heavily utilization, they account for approximately 17% of all U.S. vehicle emissions. Electrifying the heavy-duty truck segment is an essential part of transitioning the world to sustainable energy.

### Payload equal to a diesel truck

With both the U.S. and E.U. having approved higher weight allowances for electric heavy-duty trucks, we expect the payload to be at least as high as it would be for a diesel truck. In the E.U., electric semi trucks are allowed to be 2 tons (~4,400 pounds) heavier than diesel equivalents, and in the U.S. the allowance is 0.9 tons (2,000 pounds). When fully loaded, the Tesla Semi should be able to achieve over 500 miles of range, achieved through aerodynamics and highly efficient motors. This truck will be able to reach an efficiency of over 0.5 miles per kWh.

While most heavy trucking journeys are shorter than 500 miles, we want long-distance hauling to also be sustainable. We are in the process of developing a Megacharger network at trucking rest stops across the U.S. and Europe, where each Tesla Semi could top up their range.

## Battery Recycling

A common question we receive is: “What happens to Tesla battery packs once they reach the end of their life?” An important distinction between fossil fuels and lithium-ion batteries as an energy source is that while fossil fuels are extracted and used once, the materials in a lithium-ion battery are recyclable. When petroleum is pumped out of the ground, chemically refined and then burned, it releases toxic emissions into the atmosphere that are not recoverable for reuse. Battery materials, in contrast, are refined and put into a cell and will remain in the cell at the end of their life when they can be recycled to recover valuable materials for reuse repeatedly.

### Longer battery longevity is the most sustainable option

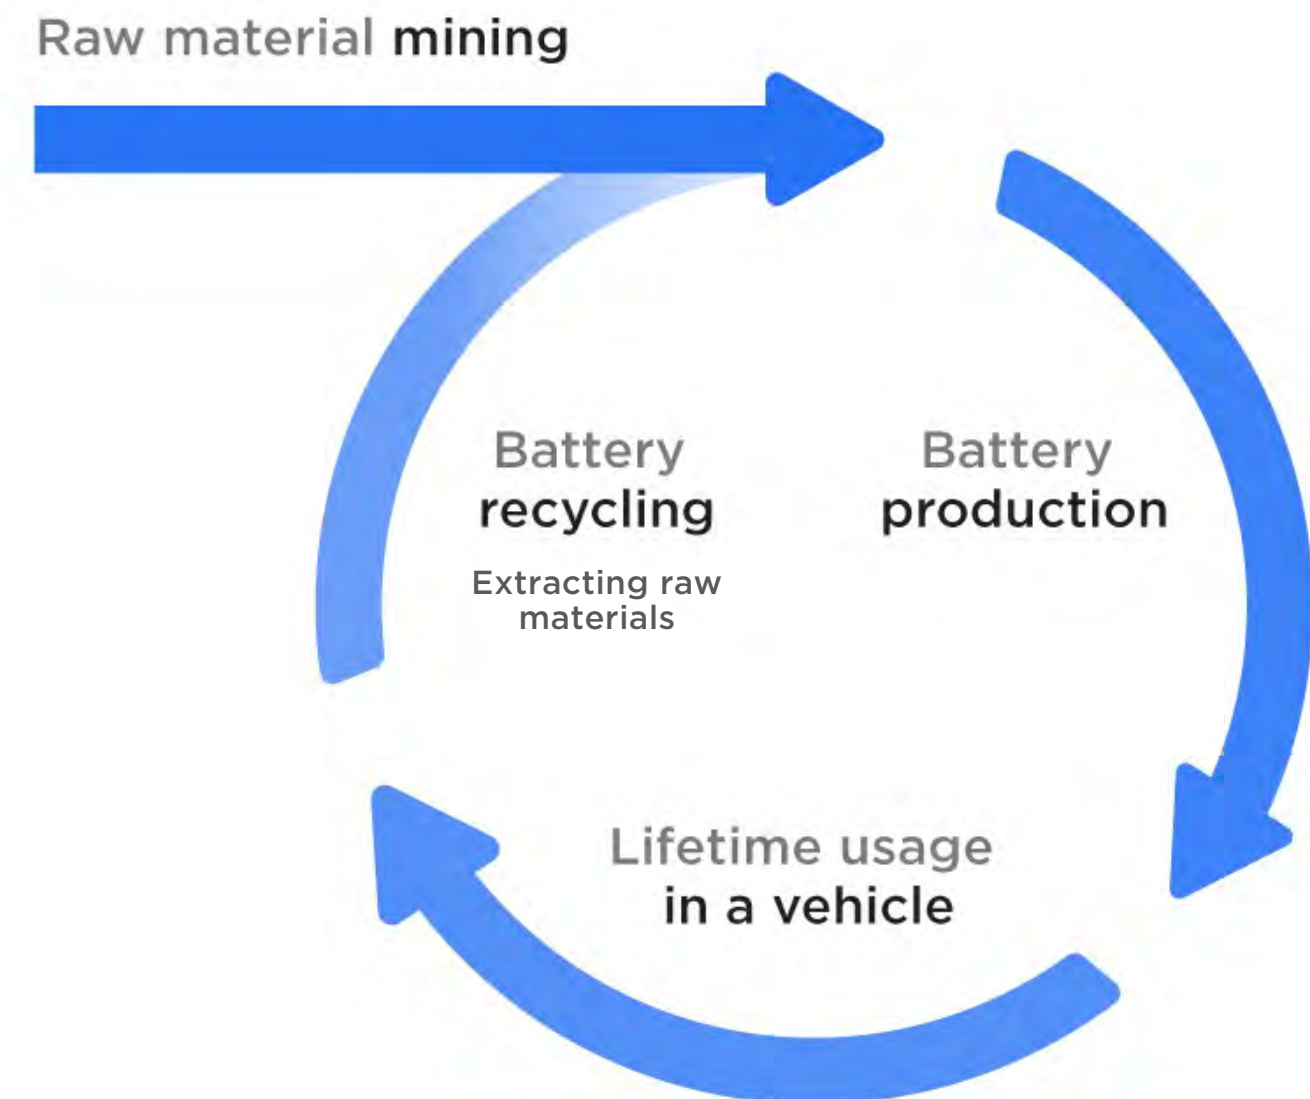

Battery pack life extension is the superior option to recycling for both environmental and business reasons. This is why before decommissioning and recycling a consumer battery pack, Tesla does everything it can to extend the useful life of each battery pack, including sending out over-the-air software updates to Tesla vehicles to improve battery efficiency when our engineers find new ways to do so. In addition, any battery that is no longer meeting a customer’s needs can be serviced at a Tesla service center.

### Every battery used in R&D or returned from the field that cannot be remanufactured are recycled

Tesla batteries, including the battery packs in our vehicles and our energy storage products, are made to last many years, and therefore, we have only received a limited number of these batteries back from the field. Most batteries that Tesla recycles today are pre-consumer, coming to us through R&D and quality control. None of our scrapped lithium-ion batteries go to landfills and 100% are recycled. Furthermore, Tesla has an established internal ecosystem to re-manufacture batteries coming from the field to our service centers. We actively implement circular economy principles and consider all other options before opting for battery recycling.

The small number of post-consumer batteries that we receive are primarily generated from our fleet of vehicles on the road, predominantly from taxi-like vehicles. Since we have only been producing Model S (our oldest model) for approximately nine years, and our energy storage products for even less time, it will likely be some time before we start receiving back vehicle batteries in larger volumes.

## Battery Materials Lifecycle

## Battery Recycling at Gigafactory Nevada

Global annual amount of lithium-ion battery metals sent for recycling by Tesla in 2020:

1,300

Tons of Nickel

400

Tons of Copper

80

Tons of Cobalt

A closed-loop battery recycling process presents a compelling solution to move energy supply away from the fossil-fuel based practice of take, make and burn, to a more circular model of recycling end-of-life batteries for reuse over and over again.

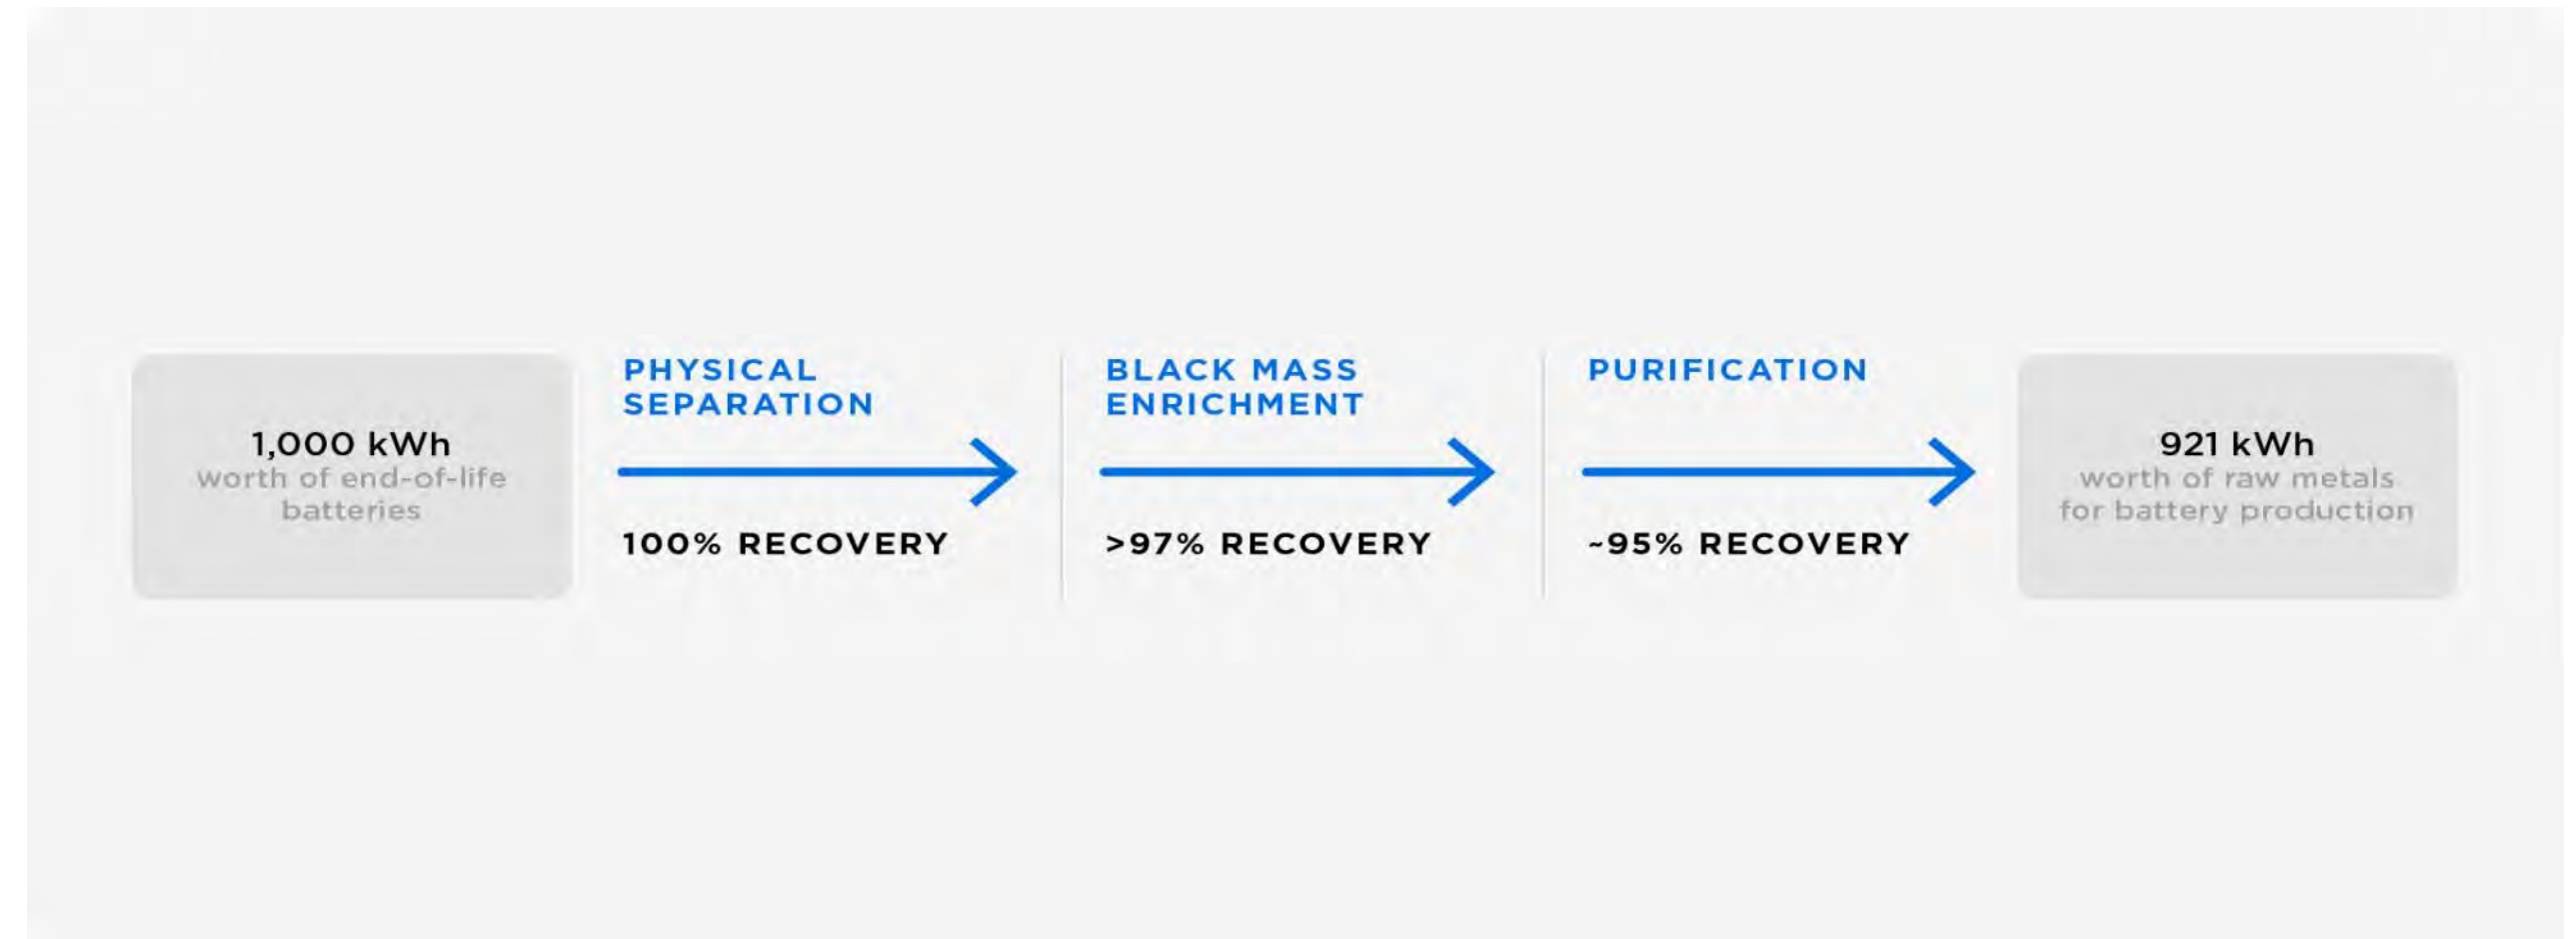

While Tesla works with third-party recyclers, we are also recycling in-house

In the fourth quarter of 2020, Tesla successfully installed the first phase of our cell recycling facility at Gigafactory Nevada for in-house processing of both battery manufacturing scrap and end-of-life batteries. While Tesla has worked for years with third-party battery recyclers to ensure our batteries do not end up in a landfill, we understand the importance of also building recycling capacity in-house to supplement these relationships. Onsite recycling brings us one step closer to closing the loop on materials generation, allowing for raw material transfer straight to our nickel and cobalt suppliers. The facility unlocks the cycle of innovation for battery recycling at scale, allowing Tesla to rapidly improve current designs through operational learnings and to perform process testing of R&D products.

Every Tesla battery factory will recycle batteries on site

As the manufacturer of our in-house cell program, we are best positioned to recycle our products efficiently to maximize key battery material recovery. With the implementation of in-house cell manufacturing at Gigafactory Berlin-Brandenburg and Gigafactory Texas, we expect substantial increases in manufacturing scrap globally. We intend to tailor recycling solutions to each location and thereby re-introduce valuable materials back into our manufacturing process. Our goal is to develop a safe recycling process with high recovery rates, low costs and low environmental impact. From an economic perspective, we expect to recognize significant savings over the long term as the costs associated with large-scale battery material recovery and recycling will be far lower than purchasing additional raw materials for cell manufacturing.

## Waste Generated Per Vehicle Manufactured

### As Tesla builds more efficient factories, our waste per vehicle decreases

Building localized factories both makes sense economically and reduces waste. Because the automotive supply chain doesn't have a strong presence on the West Coast of the U.S, many components need to be shipped from long distances, requiring excessive packaging and creating more waste than necessary.

Second, modern factories are better designed for material flow. Trailer entry points surround the whole factory, which means that components can be offloaded precisely at the part of the factory where they are needed. Less material flow results in less waste, because a shorter journey requires less protective packaging. The chart below shows that waste generation per vehicle at Gigafactory Shanghai is about half of what it is in the U.S. We are expecting our upcoming factories such as Gigafactory Berlin-Brandenburg and Gigafactory Texas to continue the same trend.

### Any materials that are possible to recycle, we recycle

The vast majority of generated waste, such as paper, plastics and metals, is recyclable. At Gigafactory Shanghai, for example, just 4% of total waste generated is not recyclable.

We continue to push for innovative approaches to reducing waste, which includes reduction of non-recyclable materials in the first place, learning from local factories and deploying improvements globally or working with our logistics team to minimize shipments and packaging per vehicle.

- Global Vehicle Manufacturing = all major factories dedicated to vehicle manufacturing, including the Fremont Factory and supporting facilities, Gigafactory Nevada, and Gigafactory Shanghai.
- Legacy Manufacturing Sites = Gigafactory Nevada, Fremont Factory and supporting facilities.
- New Manufacturing Sites = Gigafactory Shanghai.

## Water Used Per Vehicle Manufactured Current State

Currently, Tesla uses less water per vehicle than almost any ICE carmaker

There is a misconception that producing an EV requires more water than producing an ICE vehicle. Our data shows this is not the case. While each automaker may draw their boundaries slightly differently (depending on how vertically integrated they are), according to the latest publicly available figures, Tesla withdrew less water at facilities dedicated to vehicle manufacturing per vehicle produced than the majority of established carmakers. Furthermore, the efficient manufacturing design we are implementing at our new factories in Texas and Berlin-Brandenburg will result in further reductions in our water usage per vehicle. Our goal is to have industry-leading low water usage per vehicle, even when accounting for cell manufacturing. The below chart includes our latest estimates for water usage per vehicle at those facilities.

### Water usage and power generation

While many recognize the impact that power generation has on CO<sub>2</sub> emissions, its impact on water consumption is less appreciated. Power generation is one of the leading causes of water withdrawal in the U.S., as water for thermoelectric power is used to generate electricity with steam-driven turbine generators and to cool power-producing equipment. This means that every kilowatt-hour (kWh) of clean solar energy produced not only lowers CO<sub>2</sub> emissions, but also lowers water consumption.

\*Latest estimate for water consumption based on factory design. Actual production figures will not be known until factories are ramped to full production speed.

## Water Used Per Vehicle Manufactured Future State

### Future Tesla factories will set a new standard of water use per vehicle

Water is becoming increasingly scarce as the climate changes. That is why we are reducing our water usage throughout our operations as much as possible. We have prioritized direct use in manufacturing and will continue to explore the rest of our impact throughout the supply chain and in sales, service and delivery.

The “cooling tower makeup” is the single biggest contributor to water usage in any car factory after paint operations. As water that cools machinery evaporates, it needs to be topped up regularly. The total cooling tower makeup could be offset entirely by non-potable sources such as rainwater or wastewater. These are some of the initiatives we are taking at Gigafactory Berlin-Brandenburg and/or Gigafactory Texas in order to reduce water consumption per complete vehicle (including cells).

#### 1. Water intensive process optimization

We are constantly looking into reducing water consumption by optimizing or eliminating water intensive production processes across our operations. At Gigafactory Berlin-Brandenburg, we will use hybrid cooling towers, eliminate quench tanks in casting and introduce cascade rinsing systems in the paint shop and battery can wash process for cell manufacturing.

#### 2. Rainwater harvesting and reuse

We are planning to capture at least 25% of roof runoff (1 million square feet) to a central underground storage system within Gigafactory Texas. Rainwater will be recycled for use in the cooling of manufacturing equipment. In an average year, such systems should save an estimated 7.5 million gallons of potable city water.

#### 3. Reclaimed water (wastewater reuse)

Using local treated wastewater could result in offsetting the entire annual cooling tower makeup water demand with non-drinkable uses. At Gigafactory Texas, this could result in an estimated 40 million gallons of potable city water conserved annually, which equates to the total cooling tower needs for a vehicle production rate of about 250,000 vehicles a year. Reclaimed water is available and under investigation for use at both Gigafactory Texas and Gigafactory Berlin-Brandenburg.

#### 4. In-house cathode production

As we stated at our 2020 Battery Day, we are developing a more sustainable method to produce cathode in-house. This new production process will decrease the water needed by current cathode production methods used in the industry by ~95% based on our estimates. We are currently validating this new production process at our pilot production line in Fremont, California, and hope to launch it as soon as practicable.

## Emissions Credits Accelerating Deployment of New Factories

Emissions credit systems around the world are designed to economically benefit companies with non-polluting products by allowing them to sell their credits to polluting companies. In order to meet various countries' emission targets and avoid government fines, polluting companies pay non-polluting companies through credit purchases. The goal of this system is for every OEM to be incentivized to reduce emissions and themselves become non-polluting by selling more of their own manufactured EVs instead of paying another company for their non-polluting credits. We have seen strong positive signs from several OEMs who are launching competitive EVs rather than resorting to manufacturing "compliance cars," which are usually EVs built on an ICE architecture. These compliance cars are designed to meet regulatory requirements rather than to create the best possible product to help create a more sustainable future for the world.

### Emissions credit revenue is used for EV capacity expansion, which in turn displaces ICEs

In 2020, we generated almost \$1.6 billion in revenue selling zero-emission regulatory credits to other OEMs. Proceeds from such sales will go towards building new factories to produce EVs that will continue to displace ICE vehicles. While it is common practice today for ICE vehicle OEMs to purchase regulatory credits from other companies (such as Tesla) to offset their total CO<sub>2</sub> emissions, it is not a sustainable strategy. In order to meet increasingly strict regulatory requirements across the world, OEMs will be forced to develop truly competitive EVs.

### EV sales by all carmakers need to accelerate, taking market share from ICEs

In 2020, Tesla delivered almost 500,000 EVs globally. While many OEMs introduced new EV models in the past few years, with few exceptions their actual global deliveries of EVs increased only marginally. We hope that every car manufacturer will strive to produce hundreds of thousands of EVs per year, as significant reduction of emissions will only be achieved if all carmakers push for an industry-wide shift to EVs.

## Net Energy Impact of Our Products

Tesla solar panels have generated multiple times the electricity consumed by our factories

As of the end of 2020, Tesla (including SolarCity prior to its 2016 acquisition by Tesla) has installed almost 4.0 Gigawatts of solar systems and cumulatively generated over 20.8 Terawatt-hours (TWhs) of emissions-free electricity. For reference, that is multiple times more energy generated by our installations than the total energy Tesla has used to run all our factories since we began producing Model S in 2012.

We are striving to always remain a net contributor to renewable energy generation. It is our goal to eventually have all our manufacturing energy needs satisfied through renewable sources where possible. Additionally, we are hoping to see more Tesla vehicle customers installing solar panels or Solar Roof along with a Powerwall to meet their own energy needs in a sustainable way.

In conclusion, we are currently enhancing our internal processes for measuring relevant environmental data as accurately and timely as possible. Once this process is completed, Tesla will start publishing Scope 1, 2 and 3 emissions in detail.

\*Estimated based on state and country level grid data supplied by DOE and IEA. Please see appendix for detailed explanation of energy consumption figures.

# Product Impact

## Product Affordability

### Price Equivalency Between EVs and ICE Vehicles

Model 3 is the first EV to be priced on-par with ICE vehicle equivalents

Model 3 is the first EV in history priced on-par with its gas-powered equivalents, even before taking into consideration any regional subsidies and lower running costs. Unfortunately, most other EVs on the market today are still priced at a \$10,000 to \$20,000 premium compared to their direct ICE vehicle equivalents.

There doesn't need to be a tradeoff between sustainability, performance and affordability

Tesla's ability to achieve our mission rests first and foremost on our products. We are not just trying to build the best electric cars, we are striving to build the best cars, period. Our focus from the beginning has been to develop products that are not only sustainable, but also superior to fossil-fuel alternatives in every way. Many incorrectly believe that choosing sustainable products requires consumers to compromise on price or performance, but Tesla vehicles combine performance, safety, efficiency and competitive prices. Similarly, Tesla's energy generation and storage products power both urban and remote communities with reliable, affordable energy.

Starting Price of Mid-Sized Premium Sedans  
(before subsidies or dealer incentives)

## Product Affordability

### Total Cost of Ownership

Over five years of average driving, the ownership costs of a Tesla Model 3 are roughly the same as a Toyota Camry

The accessibility of our products is fundamental to our mission. While the “sticker price” of Model 3 is on-par with an equivalent BMW or Audi, the sticker price of a vehicle itself is only one of many cost items that need to be considered. The lifetime running costs of EVs are lower than those of ICE vehicles due to lower maintenance costs and cheap electricity, and the residual value of used Tesla vehicles remains exceptionally strong since we first introduced them to the market. As a result, Tesla Model 3 has a base price similar to BMW 3-series, but the total cost of ownership per mile is nearly on-par with America’s best-selling sedan, the Toyota Camry\*.

Cost data is based on data collected from our fleet

The advantage of having a fleet of vehicles that is constantly online is the ability to analyze real-world data rather than only being able to use estimates. We have an extensive database of Model 3 residual values and cost of repairs, maintenance, energy use, etc. Additionally, the insurance cost for the Model 3 SR+ below is based on the projected median insurance rate in the U.S. for Tesla Model 3 drivers. Our analysis shows that over five years and 60,000 miles, running a Model 3 SR+ costs 55 cents per mile.

Notably, running costs such as fuel (electricity or gasoline), maintenance, tires and repairs for Model 3 should cost just over half of a mass-market ICE vehicle such as a Toyota Camry.

Total Cost of Ownership (\$ per mile) - 5 years, 60,000 miles

\*Based on model year 2020 vehicles. Please see page 92 for sources.

## EVs as the Primary Vehicle

Customers are using their Tesla as their main car

For an EV to have an impact on the environment, it must be genuinely displacing internal combustion engine miles, rather than sitting in the driveway as a secondary car used for errands or short trips only. Our data show that Tesla vehicles are being driven more than average vehicles in the U.S., suggesting that they are generally being used as a customer's primary vehicle. We fundamentally believe that you shouldn't have to choose between price, quality, usability and sustainability. An EV should be the best vehicle in every way, so consumers don't ever need to use ICE vehicles.

The longer the range, the higher the usage

There is a clear relationship between range, how often an EV is utilized and whether it is a primary-use vehicle. The more confident owners are that their EV can be used for commuting, errands and long road trips, the less they will feel they need to supplement their EV with an ICE vehicle. Surveys consistently indicate that the real or perceived lack of EV range is the key reason why many people do not consider replacing their ICE vehicle with an EV.

Data tracking annual miles driven during the first three years of ownership in the U.K., collected by the RAC Foundation for non-Tesla vehicles, and data on average annual miles driven by Tesla vehicles collected from our fleet show a clear relationship between an EV's range and the annual mileage driven. Tesla vehicles (shown in blue) have by far the longest range and most annual miles driven.

## Long-Distance Travel

Freedom of travel is the reason people buy vehicles in the first place. To ensure we replace as many ICE vehicles with EVs as possible, we have been focused on increasing the range of Tesla vehicles. While most personal vehicle journeys are relatively short, and thus drivable on a single charge, consumers do not buy cars that can meet *most* of their driving needs; they buy a car that meets *all* their driving needs.

### The longer the range, the lower the Supercharger use

Since its introduction in 2012, we have increased the range of the Model S by over 50%: from 265 miles to 405 miles of range for the long-range variant. Our focus on energy efficiency—achieving superior range from the same size battery—has allowed us to continue to increase range while keeping the battery size relatively stable. Our data shows that the longer the range of our vehicles, the less Supercharging Tesla customers do. After all, day trips of over 400 miles are quite rare.

### Super-fast charging: V3 Superchargers can increase range by up to 200 miles in just 15 minutes

Around 300 miles of range at highway speeds is equal to roughly four hours of driving. At that stage, drivers are often likely to take a break. We want to make sure that such a break can be relatively short before continuing the journey. Our latest generation of Superchargers can recover up to 200 miles of range in just 15 minutes of charging, long enough for a quick break and snack.

### Substantial coverage and near-perfect reliability

In 2020 alone, we opened 743 new Supercharger locations around the world—an average of two new locations every day. We want to make sure that every highway in each of our markets is one day covered with Superchargers. At the end of 2020, the size of our Supercharging network stood at over 2,500 locations and over 23,000 stalls. Perhaps even more importantly, we have been focused on the reliability of our network. As we can see from the chart below, the chances of not being able to charge at any location at any given time are close to zero.

Uptime of Supercharger Sites<sup>1</sup>

<sup>1</sup>Uptime of Supercharger Sites reflects the average percentage of sites globally that had at least 50% daily capacity fully functional for the year.

## Active Safety

Because every Tesla car made since October 2016 is equipped with the necessary sensor suite for full self-driving, each of these cars also supports our autonomous driving development. Tesla's vertical integration and scale provides the company with billions of miles of global real-world data that is gathered as Tesla vehicles are driven. This helps us identify edge cases, train our autonomous driving system and test how a feature would perform in the real world without activating it.

### Data collection is accurate and conservative compared to industry standards

We collect the exact number of miles traveled by each vehicle with Autopilot active or in manual driving mode and do so without identifying specific vehicles to protect privacy. When there is a crash, we also receive an alert that is correlated to the exact vehicle state at the time. To ensure our statistics are conservative, we count any crash in which Autopilot was deactivated within 5 seconds before a crash, and we count all crashes in which the crash alert indicated an airbag or other active restraint deployed. In practice, this correlates to nearly any crash at about 12 mph (20 kph) or above, depending on the crash forces generated. On the other hand, police-reported crashes from government databases are notoriously under-reported, by some estimates as much as 50%, in large part because most fender benders are not investigated. We also do not differentiate based on the type of crash or fault, and in fact, more than 35% of all Autopilot crashes occur when the Tesla vehicle is rear-ended by another vehicle.

In 2020, a Tesla vehicle with Autopilot engaged in the U.S. experienced just 0.2 accidents per million miles driven while the U.S. average was ~9x higher at 2.0 accidents per million miles driven. Even in cases where only active safety features were engaged, our vehicles had a ~4.5x lower collision rate than the U.S. average in 2020.

Our commitment to safety is why all Tesla vehicles built since October 2016 come with a suite of external cameras, additional sensors and onboard computing that enable enhanced advanced safety features like Automatic Emergency Braking, Lane Departure Warning, Forward and Side Collision Warning, Obstacle-Aware Acceleration, blind spot warnings and more—all of which continue to improve over time through software updates.

Numbers of Vehicular Accidents per Million Miles Driven (2020)

For the latest quarterly accident data related to our vehicles, please view our [Vehicle Safety Report](#).

## Passive Safety

### Safety starts with our clean sheet design

Improving occupant safety has always been key to our mission. All our vehicles are built off a safety-first architecture with a low center of gravity (thanks to the positioning of our battery) and enhanced frontal impact safety (thanks to the front trunk that is void of the engine found in ICE vehicles).

### Added benefit of enhanced performance

Based on the advanced architecture of Model S and Model X, we engineered Model 3 and Model Y to be the safest cars built to date. Even though Model 3 and Model Y have no engine, their performance is similar to a “mid-engine car” due to a centered battery pack and the fact that the rear motor is placed slightly in front of the rear axle rather than behind it. Not only does this architecture add to the overall agility and handling of the car, but it also improves the capability of stability control by minimizing rotational kinetic energy.

### Model 3 and Model Y score 5-stars in all NCAP categories

After putting Model 3 and Model Y through a series of crash tests used as part of the New Car Assessment Program to calculate the likelihood of serious bodily injury for front, side and rollover crashes, the National Highway Traffic Safety Administration (NHTSA) awarded each a perfect 5-star safety rating in every category and subcategory.

2020 Tesla Model Y

2020 Subaru Outback

## Tesla Safety Awards

In 2020, Tesla vehicles earned 5-star ratings from safety rating agencies across the U.S., Europe and Australia. Furthermore, all of Tesla's safety features come standard with every vehicle and our ratings are based on our standard safety equipment. At Tesla, we do not believe that safety should be optional.

### Model X

**NHTSA

## Fire Safety

Fire incidents are ~11x lower for Tesla vehicles than the average vehicle in the U.S.

When the media reports a story about a vehicle fire, it is usually reporting on an EV fire. This is likely a result of the novelty of EV technology, rather than the prevalence of EV-related fires compared to ICE vehicle-related fires. The reality is, when compared to Tesla vehicles, ICE vehicles catch fire at a vastly higher rate. According to the latest available data, in 2019, there were almost 190,000 vehicle fires in the U.S. alone.

Due to this public misconception, we decided to start publishing vehicle fire data annually. From 2012 to 2020, there has been approximately one Tesla vehicle fire for every 205 million miles traveled. By comparison, data from the National Fire Protection Association (NFPA) and U.S. Department of Transportation show that in the U.S. there is one vehicle fire for every 19 million miles traveled.

In order to provide an apt comparison to NFPA data, Tesla's data set includes instances of vehicle fires caused by structure fires, arson and other reasons unrelated to the vehicle, which account for some of the Tesla vehicle fires over this time period.

### We continue to improve safety

We continue to improve our battery chemistry, cell structure, battery pack structure and vehicle passive safety in order to decrease fire risk to as close to zero as possible. As Tesla's vehicle technology continues to improve, fires will be even less likely for our EVs.

Finally, for the rare instances where Tesla vehicles are involved in a fire, we make [detailed information](#) available to first responders so they can safely handle those emergency situations.

We are also focused on ensuring that our vehicles are the most secure on the road. To do that, our team of world-class engineers works day in and day out to ensure that our systems are always as secure as possible. And while some of the best security engineers work at Tesla, we believe that in order to design and build inherently secure systems, we cannot work alone. We work closely with the security research community to benefit from their collective expertise and diversity of thought.

Here is a snapshot of what we do:

### Continuous product improvement

Tesla pioneered the concept of vehicles that improve and become more capable over time by ensuring that every Tesla vehicle made since 2012 can accept free over-the-air (OTA) software updates. These updates have introduced new features and functionality that have made our vehicles smarter, safer and more enjoyable to drive. We have also used the OTA system to ensure that our vehicles are not just as secure as possible when they are delivered, but that they continue to stay as secure as possible throughout their lifetime—meaning that any older Tesla vehicle that keeps its software updated through the OTA system will be just as secure as a newly built Tesla. To date, we are the only major automotive company capable of continual software enhancements across its entire vehicle fleet.

### Active engagement

Whether through formal events, such as our Bug Bounty program or the Pwn2Own research competition, or less formal channels of communication, we are constantly working with academic researchers and security experts around the world. We have found that these relationships allow us to benefit from great work being conducted by stakeholders outside of our organization who are just as passionate about digital security as we are.

For example, when researchers found a vulnerability in the Model S key fob, they reported it to Tesla, allowing us to examine their report and engineer a new in-vehicle update for the key fob, making it even more secure within a matter of seconds following the update.

The above examples are just a few of the many ways that our industry-leading team of security experts works every day to ensure our vehicles are the most secure on the road today.

# Resilience of the Grid

## Grid outages are becoming more common

Electrical disturbances in the U.S. are becoming more common, predominantly due to weather and natural disasters. According to the U.S. Department of Energy, electrical disturbances cost businesses \$150 billion per year. It is not surprising that homeowners and businesses are increasingly turning to backup power supply options.

## Low cost is key to mass adoption

We are continuously working on reducing the cost of our products in order to foster mass adoption. Ultimately, using renewable energy (such as solar or wind) with battery storage will become the cheapest energy option available, regardless of location. This is already the case in many, but not all, locations around the world. As the cost continues to decline, more customers will be able to financially benefit from turning to renewable energy.

Reported Electrical Disturbances in the U.S.

Source: U.S. Department Of Energy, Pew Charitable Trusts

<sup>1</sup> Includes cases of suspicious activity.

<sup>2</sup> Other includes all disturbances that are not clearly identified as weather, natural disaster, vandalism, attack or sabotage.

## Solar & Storage

The best way to avoid blackouts is to reduce your reliance on the grid. Tesla is a one-stop shop for taking our customers off-grid by covering a large variety of their needs. In 2020, Tesla sold 3 GWh worth of energy storage products, roughly 25% of the 12 GWh global market. In order to switch global energy usage to renewable sources, we estimate that global annual battery storage production will need to increase to ~10,000 GWh.

### Residential customers: Solar Roof, solar panels and Powerwall

Anyone can dramatically reduce their carbon footprint by installing a Tesla Solar Roof or solar panels with Powerwall. In theory, all U.S. domestic electricity needs, as well as vehicle transportation needs, could be met by sunlight alone. Naturally, installation of such a system needs to make financial sense for the customer. In Massachusetts, for example, we estimate that an average solar and storage system pays for itself with energy cost savings within approximately 12 years. As the cost of these products continues to decline, more customers will be willing to switch to solar and storage purely due to lower overall cost.

### Commercial scale customers: Megapack and renewables

The beauty of selling commercial storage systems such as Megapack is that purchasing such a product is almost purely a mathematical decision for our commercial customers. If installing Megapack makes economic sense, there is no reason not to install one. A single Megapack has on average 3,000 kWh worth of battery storage capacity, and given its scalability, enables projects over 1,000,000 kWh. Tesla Energy continues to be dependent on global cell supply. In 2020, the global demand for energy storage products continued to be far above available global supply.

Residential Solution: Solar and Storage

Commercial Solution: Solar and Storage

# Supply Chain

## Supply Chain Introduction

### Responsible Material Sourcing

## Lithium Sourcing

The vast majority of lithium used in our batteries in 2020 was sourced directly by Tesla. 100% of the lithium we sourced was mined in Australia and Argentina. We are currently looking at ways to source lithium raw material from the U.S. as well.

### Protecting human rights and the environment is at the center of our procurement strategy

Tesla is committed to only sourcing responsibly produced materials. [The Tesla Supplier Code of Conduct](#) (“Code”), [Human Rights Policy](#) and [Responsible Materials Policy](#) outline our expectations for suppliers and partners who work with us. Tesla is committed to making working conditions in our supply chain safe and humane, ensuring that workers are treated with respect and dignity and building manufacturing processes are environmentally responsible. Tesla suppliers are required to provide evidence of management systems that ensure social, environmental and sustainability best practices in their own operations, as well as to demonstrate a commitment to responsible sourcing into their supply chains.

### As our business grows, our strategy evolves according to changing opportunities and risks

Our existing Conflict Minerals Steering Committee has broadened its scope to include the Responsible Sourcing Steering Committee in recognition of the diverse sourcing issues Tesla faces as we expand our manufacturing locations globally. The committee includes members of senior leadership from supply chain, compliance, environmental health and safety, investor relations, internal audit, legal and policy. This diverse group of stakeholders allows consensus to be found on addressing existing issues while also discussing emerging areas of risk or concern and finding ways to mitigate negative impacts as soon as possible. Risks are prioritized based on several factors: their impact on human rights, significance to the business, Tesla’s ability to drive change and our relationship with the supply base, among other things. Tesla has also established dedicated internal supply chain resources to manage responsible sourcing efforts.

Our complex supply chain is a unique hybrid of the traditional automotive and high-tech industries and encompasses suppliers from around the world. Many of our Tier 1 suppliers (*i.e.*, direct suppliers) do not purchase all of their raw materials directly and instead obtain them from their suppliers and sub-suppliers. Therefore, reliably determining the origin is a difficult task, but the due diligence practices required of our suppliers adds transparency to help us and our suppliers adhere to the responsible sourcing principles of our Code and guidelines established by the Organization for Economic Co-operation and Development (OECD) and Responsible Minerals Initiative (RMI).

### We require our suppliers to follow stringent, internationally accepted standards

Our Tier 1 automotive suppliers are required to register and complete the domestic and international material compliance requirements in the International Material Data System (IMDS) to meet EU and other international material and environmental-related regulations. This requirement is mandated for all suppliers who supply their products or raw materials to us as part of our production-parts approval process. Tesla, along with our partners and independent third parties, conducts audits to observe these principles in action. If there is a reasonable basis to believe a supplier partner is in violation of the Code, Tesla will transition away from that relationship unless the violation is cured in a satisfactory manner.

## Cobalt Sourcing

### Human rights issues in the cobalt supply chain require a robust approach to due diligence

Tesla's supply chain due diligence program and efforts to conduct a country-of-origin inquiry with respect to our entire supply chain are in line with the OECD Due Diligence Guidance for Responsible Sourcing from Conflict-Affected and High-Risk Areas (OECD Guidelines). In addition to following our due diligence program requirements, all suppliers, sub-suppliers and mining companies within Tesla's supply chain are required to adhere to our Code, including taking a proactive approach to reducing environmental and resource impacts. All our suppliers are also expected to follow our [Code of Business Conduct and Ethics](#), including avoiding any activities related to corruption, conflict of interest or money laundering and any actions that would harm the health and safety of their employees.

In order to further increase the transparency of our cobalt supply chain, we collect detailed data from relevant suppliers using the RMI Cobalt Reporting Template. Because Tesla recognizes the history of human rights issues within cobalt supply chains, particularly in the Democratic Republic of the Congo (DRC), we have established processes to prevent these risks in our supply chain. We also recognize that mining conducted in a responsible and ethical manner is an important part of the economic and social well-being of those communities. We review all information provided by our suppliers for red flags and risks associated with ethical sourcing. Where we can be assured that minerals, including cobalt, are coming from mines that meet our social and environmental standards, we will continue to support sourcing from the DRC and other regions.

## Cobalt in Our Battery Supply Chain and Our Diversified Cathode Strategy

As Tesla expands our global manufacturing operations, our supply chain will continue to grow and become more complex. Regardless of this increased complexity, we continue to maintain high standards for our suppliers' business practices and respect for human rights. Prior to introducing a new battery cell supplier or sub-supplier, we require them to disclose a full mapping of their cobalt supply chain and to provide a recent, verified, independent third-party audit conducted on the refineries within their supply chain over the prior 12-month period, along with evidence of implementation of any corrective action plan following such audit.

### Third-party audits and ad-hoc Tesla-led inspections of cobalt suppliers and refiners help ensure compliance

Once a supplier is approved and integrated into our supply chain, Tesla requires these same suppliers to conduct ongoing annual third-party audits in accordance with the latest edition of OECD Guidelines and the commitments adopted by the RMI in their Cobalt Refiner Supply Chain Due Diligence Standard. We also conduct ad-hoc Tesla internal inspections of our cobalt refiners to ensure ongoing compliance throughout the annual cycle. Following results from conducted audits, we engage with our suppliers to implement audit recommendations as part of a process of continuous improvement of our supply chain. To date, we have not identified any instances of any human rights violations in our cobalt supply chain.

### Our nickel-based cathode has less cobalt content than similar chemistries used elsewhere in the industry

Tesla's batteries contain a variety of different cathode chemistries, including nickel-cobalt-aluminum (NCA) and nickel-cobalt-manganese (NCM) for higher energy applications and lithium-iron-phosphate (LFP) for lower energy applications. Tesla's batteries that use nickel-based cathode materials contain less cobalt than other similar cathode chemistries used in the industry. We continue to work toward batteries that contain lower levels of cobalt, and for some applications it may be eliminated entirely in the future. The trend toward higher nickel cathodes is designed to improve vehicle range while lowering overall battery costs, without compromising overall cell performance, such as battery safety and lifetime that is currently enabled by the use of cobalt. Tesla will continue to work to advance a diversified cathode strategy for both LFP- and nickel-based cathodes with varying cobalt contents (ranging from zero to low percentage amounts), for both our vehicle and energy products.

### While we work to eliminate cobalt from our cathode long-term, in the short-term it will continue to be an important material

It is important to note that we expect our absolute cobalt demand to increase over the coming years because our vehicle and cell production growth rate is forecasted to outpace the overall rate of cobalt reduction on a per-cell basis. Tesla is committed to using only responsible sources of cobalt; ensuring transparency and preventing instances of human rights violations associated with cobalt are priorities in our supply chain due diligence.

## How We Managed Our Battery Cobalt Supply Chain in 2020

Any of our suppliers or sub-suppliers sourcing from the DRC must exclusively source from RMAP conformant refiners

In 2020, our battery cell sourcing was divided into three distinct supply chains for cobalt: Gigafactory Nevada and Fremont external cell sourcing, Gigafactory Shanghai and Fremont in-house cell production. For Gigafactory Shanghai and Fremont in-house cell production, we procure cobalt materials directly from producers that are verified as compliant with Tesla’s Code and with whom we have direct contractual obligations around responsible sourcing per OECD Guidelines. We work with participants along the value chain to shorten the supply chain by eliminating third-party cobalt refiners and by ensuring that Tesla’s material is stored in clearly marked, segregated areas of the plant and is toll processed on lines dedicated for Tesla. For Gigafactory Nevada and Fremont external cell sourcing, where Tesla does not directly procure cobalt materials, cobalt is sourced by our battery cell suppliers from many different countries (listed below). For material originating from the DRC, Tesla’s battery cell supplier and sub-suppliers are required to purchase refined cobalt exclusively from qualified, conformant cobalt refiners as per the Responsible Minerals Assurance Process (RMAP) standards set forth by the RMI.

Audits are conducted by third parties approved by the RMI, and an “Active” or “Conformant” classification provides an acceptable level of supplier transparency. Currently, the only suppliers with a “Not Listed” classification that Tesla has a relationship with do not source minerals from the DRC.

Tesla 2020 Supply Chain List of Miners & Refiners for Purchased Cobalt Materials

Battery Supply Chain	Cobalt Miner & Refiner		
	Sourced from DRC	Supplier	RMI Classification*
Gigafactory Nevada and Fremont external cell sourcing	Yes	Umicore Finland Oy (Finland)	Conformant
	No	Murrin Murrin Nickel Cobalt Plant (Australia)	Conformant
	No	Norilsk Nickel Harjavalta Oy (Finland)	Active
	No	Harima Refinery, Sumitomo Metal Mining (Japan)	Conformant
	No	Sumitomo Metal Mining (Japan)	Active
	No	Guandong Fangyuan Environment Co. Ltd. (China)	Not Listed
Gigafactory Shanghai	Yes	Kamoto Copper Company (DRC)	Conformant
	Yes	Guizhou CNGR Resource Recycling Industry Development Co., Ltd. (China)	Active
Fremont in-house cell production	Yes	Kamoto Copper Company (DRC)	Conformant
	Yes	Quzhou Huayou Cobalt New Material Co., Ltd. (China)	Active

\*A smelter or refiner is considered “Conformant” when they have passed a third-party audit to industry accepted standards covering their internal processes and policies on due diligence to identify and mitigate the risk of human rights abuses in their supply chain; “Active” means a smelter or refiner is pursuing certification through one of the approved auditing processes; “Not Listed” means a smelter or refiner is not yet listed on the RMI’s Cobalt Reporting Template and may not yet have been engaged by the RMI to participate in the RMAP or equivalent program.

## Cobalt in Non-Battery Parts of Our Supply Chain

We are committed to managing cobalt throughout our entire supply chain (not just in our cathode)

While Tesla's battery supply chain is the most significant portion of our cobalt sourcing activities, our supply chain due diligence efforts are not limited to these suppliers listed in the prior table. We also engage with any suppliers that use cobalt in their part-material composition and work to collect additional information from them on the origin of these materials and their associated risk-reduction efforts. Tesla leverages the automotive industry's IMDS to best identify those of our automotive suppliers whose parts include cobalt. In addition, our energy production and storage business segment suppliers are asked to provide information on their cobalt sourcing, so we can apply the same standards to our Tesla Energy suppliers as we do to our automotive suppliers and sub-suppliers.

Transparent sourcing of cobalt for our supply chain allows us to better ensure procurement is done in an ethical and responsible manner. Through our membership with the RMI, other organizations and our sourcing decisions Tesla continues to emphasize the importance of responsible sourcing of cobalt both inside and outside of the DRC. This additional engagement effort is part of a business decision to improve Tesla's supply chain transparency, improve our due diligence practices and minimize supply risk.

## Battery Materials Sourcing

\* “Tailings management” refers to the practice of managing mining bi-products leftover after valuable minerals have been extracted from a mining site.

### The scope of our due diligence within our battery supply chain extends beyond cobalt

In this year’s report, we have decided to extend the scope of our battery supply chain disclosure beyond cobalt. We recognize that the battery materials lithium and nickel are among the highest contributors of carbon emissions in the battery cell supply chain and present complex challenges related to environmental and social governance. For this reason, much of our responsible sourcing efforts in 2020 were focused on these materials and their use in the cathode supply chain.

### Direct engagement with upstream producers allows us to better manage social and environmental concerns

Tesla continues to expand the scope of its battery metals procurement strategy by executing long-term agreements directly with upstream producers and mining companies to supply Gigafactory Nevada, Gigafactory Shanghai and our Fremont Factory. Tesla works directly with mineral producers and refiners that are aligned with our mission and are committed to supplying sustainably and responsibly sourced materials in accordance with our Code and other policies protecting human rights. The battery metal producers we work with directly in our supply chain have committed to the standards of ethical business, environmental performance and social responsibility set by the International Council on Mining & Metals (ICMM) and/or the Initiative for Responsible Mining Assurance (IRMA).

### This work provides greater transparency into our supply chain environmental footprint—and we will continue to expand the scope

By collaborating directly with producers, we can more effectively reinforce our auditing, monitoring and due diligence practices and address sustainability issues such as biodiversity impact, energy consumption, human rights and tailings management\*. Where we discover any risks within our supply chain around environmental, social or other concerns, we will work with the respective party to mitigate that risk and drive for resolution. We have also engaged with our suppliers to collect CO<sub>2</sub> emissions data to determine a baseline of the carbon footprint of our cathode supply chain. Over the coming years, we will continue to work with our suppliers to standardize and streamline the methodology for emissions calculation, identify opportunities for reducing the carbon footprint of our supply chain and expand the scope to include other battery materials beyond cathode.

## Battery Materials Sourcing

### 2020 Battery Day Highlights

On September 22, 2020, Tesla hosted Battery Day where we presented several developments in our cathode technology roadmap, which are designed to enable the scaling of cathode materials production to TWh/year scale, and in doing so improve the sustainability of our cathode materials.

#### Our novel in-house cathode development aims to reduce resource intensity and the use of hazardous chemicals

Tesla will begin in-house production of precursor and cathode materials, leveraging novel processing techniques that we are developing to reduce costs while positively impacting the environmental footprint when compared to the conventional process used in the industry. Tesla's new cathode process will aim to:

- Reduce the energy intensity of the process and the number of process steps;
- Eliminate the use of hazardous chemicals, such as sulfuric acid and caustic soda; and
- Reduce water consumption by >95%, thereby eliminating a significant waste stream.

#### Our novel in-house process for refining of U.S. lithium resources will reduce carbon emissions and sulfate biproducts

We also announced plans to scale in-house lithium refining and the development of U.S. lithium resources in the future. An integrated lithium strategy will enable Tesla to:

- Create a domestic U.S. lithium supply chain by sourcing spodumene raw material within the U.S., thereby reducing emissions related to the transportation efforts of moving material from traditional lithium-producing countries in South America and Australia; and
- Commercialize a non-standard flow sheet that will eliminate dependence on sulfuric acid and sodium hydroxide, thus removing sulfate biproducts generated during the traditional spodumene conversion process.

#### Our closed-loop production, including in-house recycling, will further reduce carbon emissions in battery manufacturing

Finally, our closed-loop cathode production via in-house battery recycling and metals refining will enable us to:

- Recover >99% of the metals contained in scrap and end-of-life batteries and convert these metals directly back into cathode materials for re-introduction into our cell production; and
- Bypass the extractive processing systems (mining), which significantly reduces the carbon footprint of metals contained in our battery cells.

## Battery Materials Sourcing

### Our Participation in International Multi-stakeholder Initiatives

**We are working with others in the industry to drive greater transparency, opportunity and equity in our supply chain**

In addition to our in-house cell production and responsible sourcing efforts, Tesla is engaged in several new cross-industry initiatives, including our memberships to the Global Battery Alliance and the Fair Cobalt Alliance, as well as collaborating with various battery supply chain participants to implement technology solutions using blockchain to improve our supply chain transparency and traceability programs for nickel and cobalt.

**Global Battery Alliance (GBA):** In mid-2020, Tesla began participating in the GBA’s Human Rights and Child Labor and Greenhouse Gas (GHG) Footprint working groups. This GBA multi-stakeholder effort, including members from throughout the industry, is undertaking the creation of a “Battery Passport” to give consumers greater visibility into the environmental and societal impact of lithium-ion batteries. Tesla joined the GBA as a full member in 2021. Tesla has also helped GBA in its transition from being incubated by the World Economic Forum to a fully functioning and independent entity today and has joined the GBA’s Board of Directors.

**Fair Cobalt Alliance (FCA):** Artisanal cobalt represents 10-20% of the DRC’s cobalt supply and provides a source of direct employment for more than 100,000 people in the DRC. In 2020, Tesla joined the FCA, whose mission is to positively transform and professionalize the artisanal mining sector (ASM) by adopting safer mining practices, to eliminate and prevent child labor by allowing children and youth access to education and vocational training and to increase household incomes and reduce poverty by supporting the transition of ASM communities to more sustainable livelihoods. The FCA is an action platform that engages with both the national and provincial governments of the DRC, as well as with civil society and technical partners to achieve its objectives.

## Battery Materials Sourcing Our Participation in International Multi-stakeholder Initiatives

### Re|Source Blockchain Collaboration for Cobalt

Tesla has been collaborating with the Re|Source consortium founded by the leading industrial cobalt producers in the DRC—China Molybdenum, Eurasian Resources Group and Glencore—to develop a blockchain platform by creating a transparent, open and global registry that aims to ensure that all cobalt used in end-products is sustainably sourced and users can account for and verify the provenance of each unit. Tesla selected to collaborate with Re|Source because it is industry-led, is designed to be readily accessible and inclusive to all parties across the supply chain and is scalable, which means it can include other critical battery materials in the future.

Upon completion, the system will allow users to fully track cobalt from the mine to the battery with assurance that the volume of traceable material is understood as well as the sustainability efforts of upstream suppliers. This solution will be piloted in real operating conditions, starting from the cobalt production sites in the DRC all the way through to electric vehicle production sites. Tesla is participating in this pilot program, scheduled to run until the end of 2021. The full roll-out of the platform is expected in 2022.

### BHP Blockchain Collaboration for Nickel

Tesla has partnered with BHP in a blockchain pilot program to improve supply chain transparency and assess various sustainability criteria. Over a three-month period, we traced nickel shipments from BHP's Nickel West operations in Western Australia through the various transformation phases right through to vehicle production in Gigafactory Shanghai.

This program supports Tesla's supply chain due diligence product provenance and confirms if any raw material "dilution" occurs in the supply chain. Furthermore, blockchain's digital nature enables scalability of the technology and CO2 tracking validates the environmental footprint for Tesla's vehicles, allowing the supply chain to adjust its long-term strategies on emission minimization and leverage those in day-to-day operations. These will be included in important disclosures that will eventually form part of an environmental battery passport and future EU battery regulation. The pilot also enabled us to identify potential inefficiencies in supply chains and suggest pathways for improvement.

All the initiatives described above will contribute to Tesla aligning with regulations incentivizing transparency, traceability and sustainability across the battery supply chain, including through clear external communication with relevant third parties.

# People and Culture

## Introduction

Tesla is on a mission to accelerate the world's transition to sustainable energy. We focus relentlessly on innovation and rely on collaboration across our teams to help achieve this goal. Along the way, we are committed to maintaining safe and humane working conditions, ensuring that all workers, including those within our supply chain, are treated with respect and dignity and that our manufacturing processes are environmentally responsible. Internally, we are continuing to build a culture that is safe, respectful, fair and inclusive for all our employees.

As cliché as it sounds, it is only thanks to our employees that we've gotten to where we are today. If we expect to continue innovating and changing the world for the better, we must ensure we have a talented and engaged workforce with ample opportunity to contribute to our mission and grow professionally.

At the center of Tesla's strategy is:

- Regular and meaningful engagement with our employees;
- A robust culture of safety;
- Clear development pathways for all our employees;
- Highly competitive compensation programs; and
- Principles of diversity, equity and inclusion built into all aspects of hiring, promotion and retention.

## Our Response to COVID-19

### Six-Step Return/Resume Operations Plan:

1. Prepare the Building
2. Prepare the Workforce
3. Control Access
4. Create Social Distancing Plans
5. Reduce Touchpoints and Increase Cleaning
6. Verify

We planned very early—with Gigafactory Shanghai as the blueprint

In December 2019, we started planning for the potential spread of COVID-19 outside of China. Because Tesla had proactively worked early on with our Gigafactory Shanghai operations on how the local government and businesses responded to COVID-19, we were better prepared on the ground in our other global locations before the impact was felt in the rest of the world. Specifically, we convened a pandemic management team at the leadership level and created a Tesla Playbook, including COVID-19 response plans, policies and best practices. This team also implemented a six-step Return/Resume Operations Plan, which involved Tesla’s EHS, HR, Security and Travel teams, including members at all levels of the organization, from associates on the ground up through leadership, conducting risk assessments and executing plans to minimize identified risks.

#### Fact and figures\*

- A track-and-trace system was implemented—99.9% effective at stopping spread of the virus
- We saw fewer than 40 workplace transmission cases of COVID-19 in all of 2020
- Employee COVID-19 testing positivity rates were less than half the community rate, whether they were in the workplace or working remotely
- All employees received COVID-19 prevention training
- Launched touchless vehicle delivery option globally in 2020
- Free vaccines for employees aged 65+ began on March 1, 2021
- Free vaccines for all employees began on April 16, 2021

## Human Rights

Tesla believes the ethical treatment of all people and regard for human rights is core to our mission of a sustainable future. We also believe all businesses within our supply chain have a responsibility to support our mission and share our respect for human rights. This human rights policy is the formalization of our commitment to uphold and respect these rights and the values they represent

We endorse and base our definition of human rights on the United Nation's Universal Declaration for Human Rights (UDHR). The UDHR focuses on dignity, respect and equality, without discrimination, for all people. We are committed to upholding these rights and values throughout our value chain—including with respect to our employees, customers, shareholders, suppliers and the communities in which we operate. We expect that our suppliers will also support and promote these values in their own operations and in those of their own suppliers.

Addressing human rights risks is an ongoing effort, involving engagement with our value chain for potential impacts, incorporating input from external stakeholders and reviewing and updating our own policies where necessary. With this understanding, Tesla is committed to addressing any potential human rights issues both within our own operations and those of our value chain.

[You can see our full Human Rights policy here.](#)

## Human Rights

### Human Trafficking, Modern Slavery and Child Labor

We have a zero-tolerance policy when it comes to child or forced labor and human trafficking by our suppliers

At Tesla, we are committed to ensuring that the way we conduct our business and dealings with our suppliers reflects our values and our belief that everyone should be treated with dignity and respect. Tesla is committed to ensuring that our suppliers do not use slave or child labor or engage in human trafficking. Modern slavery, child labor and human trafficking are crimes under the laws of countries throughout the world, but unfortunately continue to exist all over the globe. Our commitment on this front is summarized in the [Tesla Supplier Code of Conduct](#) as well as in our [Human Rights Policy](#) and [Responsible Materials Policy](#), and we continue to work to ensure that our suppliers uphold the principles in these statements. We look to the OECD Due Diligence Guidelines to inform our process and use feedback from our internal and external stakeholders to find ways to continually improve it.

Through our commitment to enforce our Supplier Code of Conduct, Human Rights Policy and Responsible Materials Policy, continuous training and the supplier audit and due diligence efforts, Tesla believes that there is minimal risk of, and have found no evidence to date of Tesla causing, contributing to or being linked to modern slavery, child labor or human trafficking in our supply chain.

For more information on our commitment to anti-slavery practices and an affirmation of the values we hold and adopt across Tesla's business operations and supply chain, including how we assess risks and effectiveness of our actions, please see our [California Transparency in Supply Chain Acts Statement](#) and our [U.K. Modern Slavery Act Transparency Statement](#).

## Employee Engagement

Since our earliest days, Tesla has been built upon a culture of open communication. Over the years, as Tesla has grown as a company, we have worked to maintain this culture. Quite simply, we believe that raising matters openly and discussing them freely is the best way to solve problems and ensure a healthy, fulfilling, productive and amicable workplace. Employees have the right to freely discuss their wages, benefits and terms and conditions of employment and to raise complaints internally or externally.

Tesla encourages employees to bring any concerns or complaints they may have to any member of management. This open communication is a reality at Tesla and employee concerns are given attention as promptly as possible. While the open floor policy is available to all employees at any time, we all have a role to play in ensuring we maintain a respectful and safe workplace. To this end, any employee who is subjected to, a witness of or has knowledge of any conduct that violates Tesla policies, is asked to immediately report the conduct. Members of management may be subject to discipline if they fail to report in a timely manner.

Our employees can report concerns to their supervisor or HR partner. If they prefer to report another way, the Integrity Line is available 24 hours a day, seven days a week. The Integrity Line allows employees to report concerns anonymously and without fear of retaliation. Consistent with the U.N. Guiding Principles, Tesla publicizes the Integrity Line to promote accessibility, including an internal website link for quick and easy access. Concerns are reviewed in accordance with established protocols by investigators with expertise in employee relations, human relations, compliance, information security, internal audit and environmental, health and safety. Investigations teams periodically review trends, outcomes and opportunities for remediation and appropriate controls.

## Our EHSS Strategy

Becoming the Safest and Most Resilient Company in the World

At Tesla, we are driving safety by shifting our focus to listening to and learning from the people closest to our operations.

# 1.3 million+

EHSS Engagements in 2020<sup>1</sup>

In 2020, we had a record number of worker engagements, including safety suggestions, inspections, audits and trainings. Engagements at every level are what enable us to be proactive in our approach to the environment, health, safety and security.

**Our Environmental, Health, Safety and Security (EHSS) strategy remains focused on three pillars:**

1. Do the basics right
2. Engage and empower our stakeholders
3. Reduce risk

How we measure success—aligning our metrics so health and safety can be managed globally

As we grew as a global company, so did our perspective on injuries and illnesses. In 2020, we shifted our focus to the elimination of fatal and serious injuries. Part of that change was trending our data against the ASTM standard E2920-19, a safety metric that captures cases with a meaningful connection to work and cases with such potential consequence that they have value for prevention purposes. This standard is intended to define world-related injuries and illnesses in a way that can easily be understood and measured across countries, which better represents our expanding global footprint. The resultant data and incident rates improve global benchmarking consistency, which enables us to provide greater transparency and better protect our workers.

<sup>1</sup> EHSS = Environmental, Health, Safety and Security. In 2020, our Security team joined the larger EHS organization becoming EHSS. Our engagement figures in 2020 are not comparable to 2019 given this new team structure and the addition of trainings in the measurement. In addition, COVID-19 safety efforts drove substantially higher engagements across the organization.

\*Industry average from latest available data, which is 2019. See our appendix for more details.

## 17% below industry average

Tesla's ASTM Level One Rate is 17% below the industry average\*.

## Safety Improvements

As our production volumes increase, our incidents per vehicle continue to drop

Our main objective is to identify events with a meaningful connection to our employees' daily work and recognize similar situations with comparable potential consequences for prevention purposes. These events can be used to evaluate, compare and continually improve management systems and programs related to worker safety and health.

Although we have turned our attention away from traditional lagging metrics, we maintain historical records for comparative purposes. We continue to see reductions across all OSHA injury rates for Total Recordables (TRIR), Days Away/Restricted Time (DART) and Lost Time (LTIR), which translates to fewer injuries per 1,000 cars produced.

## Safety Improvements Factory Highlights

### 18% below industry average

Fremont TRIR is 18% below the NAICS industry average for automobile manufacturing.

### 19% below industry average

Fremont DART is 19% below the NAICS industry average for automobile manufacturing.

The Fremont Factory achieves injury rates far below the industry average

As our worker engagement increased throughout 2020, our Fremont Factory injury rates decreased. Compared to the automotive national industry average, we continued to drive performance through the integration of safety in design and focusing on the presence and effectiveness of safeguards.

2020 Fremont Factory TRIR

2020 Fremont Factory DART

### External Certifications for Tesla Factories

Gigafactory Nevada, Gigafactory New York and Gigafactory Shanghai were externally certified for ISO 14001 and ISO 45001, which are the international standards for implementing an environmental management system and managing health and safety concerns. Gigafactory Nevada also submitted Tesla's first application for a voluntary protection plan, which is a partnership between Tesla and NVOSHA. Transparency with regulators continues to be key to our strategy.

## Safety Improvements Active Engagement

### Take Charge Program

Take Charge is a new EHSS program designed to empower all Tesla employees to assist in building a strong safety culture by submitting improvement ideas for environment, health, safety or security at Tesla.

### Health and Safety Committees enable real-time feedback, driving improvement in EHSS processes and outcomes

Across our operations, we have effective and engaged Health and Safety Committees that include representatives from production and management. The initiative is managed by our EHSS team, but the exact structure and function is determined by teams on the ground depending on their location and function. We are striving to create a culture where we learn and improve by involving the people closest to the work.

For example, in Fremont, our General Assembly 4 (GA4) - Model Y - EHS Committee is a combination of Production, Quality, and Production Control (PC) associates. The cross-functional nature of the membership is meant to encourage collaboration between all production teams who work in GA4. Activities undertaken by the committee include action tracking for top risks, safety audits, proactive safety discussions, recognition and spotlights for associate-led improvements and discussing concerns or risks brought up by the peer group. Safety members have also been trained on the Take Charge\* program and have been leading the initial roll-out in GA4.

In Energy, Committees are both national and regional in nature across North America, APAC and EMEA. They include a variety of formats to suit our geographically and functionally diverse business. Much like the GA4 team, the objectives of the committee center around improving EHS outcomes by conveying important information regarding incidents, new products or safety techniques, and other relevant learnings for the organization. Meetings are centered on sharing feedback and improving our processes.

All EHS committees utilize real-time chat functionality that allow the teams to communicate issues and ideas and collaborate on health and safety improvements. Associates can take pictures of concerns and address issues in real time within the group chat.

### Site EHS Representative Program for Sales, Service and Delivery (SSD)

To keep a geographically distributed and diverse organization informed and aligned, a Site EHS Representatives program has been instituted globally. Up to two EHS ambassadors are recruited at each SSD site. The Representatives help with safety and compliance tasks such as workplace inspections, disseminating EHS-related information, relaying feedback to regional EHS specialists, participating in monthly employee safety committee meetings and monthly regional EHS representative trainings and assisting with incident reporting and investigations. Site EHS Representatives attend monthly calls that center on education and sharing of issues and concerns.

Safety Committee Meetings are held monthly in each region to facilitate information sharing and encourage collaboration. Participants in the monthly safety committees include technicians, Tesla Advisors, managers, engineers, business partners and regional leadership. Meetings cover company news, review of incidents and trends, educational content on relevant EHS topics, one-point lessons, upcoming EHS events, trainings, Safety Alerts, Take Charge and recognition.

## Rewarding the Individual

Tesla offers wages and benefits that meet or exceed those of other comparable manufacturing jobs in the regions where we have a presence, and we recently increased our base pay even further. In addition, unlike other manufacturers, the majority of employees have the opportunity to receive additional Tesla equity each year based on their performance, which can result in significantly higher compensation beyond our already industry-leading base compensation.

### The impact of stock-based compensation can be material for employees

Our employees have benefited enormously from value appreciation seen through the years. While share prices will remain volatile and past performance is not indicative of future results, stock-based compensation brings shared ownership to the workforce, and our employees are encouraged to make a positive change for the benefit of all. Culturally, shared ownership of the company is one of the most essential attributes of working at Tesla.

For example, assume that an employee received a grant of 320 Tesla shares in 2018 that vested 20 shares quarterly over four years. Based on the stock price at the time of the grant, the vest of 20 Tesla shares per quarter would equate to \$1,331-worth of sellable shares at the end of 2018. However, the same vest two years later would equate to \$14,113-worth of sellable shares per quarter based on the increase in the price per share of Tesla stock over that period.

Employees are also eligible to buy additional stock at a discount through the Employee Stock Purchase Program.

## Rewarding the Individual Growth, Pay and Advancement

### Continuous recruitment

Our employee count has grown ~80 fold over the past decade. While many companies in the automotive industry have been trimming the number of employees and launching various early retirement schemes, we are planning to grow our employee base for years to come.

### Compensation

Tesla provides a highly competitive wage that meets or exceeds that of comparable manufacturing roles, even before equity and benefits are factored in. In 2020, Tesla's average national wage for manufacturing jobs in the U.S. was \$21.14/hour plus benefits (which, among others listed on the next page, includes an option for \$0 cost paycheck deductions) and equity, which is a 10.7% increase compared to 2019. According to the Bureau of Labor Statistics, the mean hourly wage for Production Associates / Assemblers is \$16.73 and the median is \$15.55. Tesla continuously reviews salary and wages against benchmarks and adjusts to ensure wages are competitive. Evaluations for promotions also take place annually.

### Pay equity

At Tesla, we believe that equal work deserves equal pay. That is why we have a robust process for ensuring pay equity across our organization. We constantly evaluate our pay levels to help ensure that no pay gaps are created.

### Career advancement

Tesla makes an effort to promote from within and a weekly email is sent to all employees listing available job openings with instructions on how to apply. Candidates are interviewed and selected based upon their skills and how they line up with the vacancy.

## Rewarding the Individual Benefits

Our comprehensive benefits have evolved alongside the needs of our diverse and growing workforce

Tesla proudly offers a comprehensive range of benefits options to support our employees' health and well-being in every region of the world in which we operate. Our benefits allow our employees to choose the level of support that is right for them and their stage of life. We offer no-cost paycheck contributions for medical, dental and vision plan options for employees and family members. We also offer employer-paid life, short- and long-term disability, confidential counseling for employees and their families, employee assistance programs and voluntary benefit programs.

We support our employees every day so that they can be at their best, both at home and at work. We also offer student loan and debt consolidation services, transportation subsidies and \$0 cost shuttles, back-up childcare, discount programs and tools and resources to support growing families.

Below is a summary of the range of benefits that we offer our employees; our offerings have evolved alongside the needs of our diverse workforce:

Since 2007, we have provided:

- A \$0 paycheck contribution medical plan
- A Confidential Counseling/Employee Assistance Program
- A \$0 paycheck contribution dental plan
- A \$0 paycheck contribution vision plan
- A \$0 cost shuttle service to and from underserved transportation hubs in California and Nevada
- Employer-paid life insurance
- Employer-paid short-term disability
- Employer-paid long-term disability

Since 2016, we have provided:

- SafetyNet, a benefit that provides limited financial assistance for employees experiencing temporary hardship such as the sudden loss of housing, emergencies/natural disasters or expenses related to the loss of an immediate family member

Since 2018, we have provided:

- 5 days of back-up child/elder care for employees
- Infertility benefits, including assisted reproductive technologies
- Transgender benefits aligned with the clinical protocol set forth by the World Professional Association for Transgender Health

Since 2019, we have provided:

- Rethink, a benefit that provides resources for families with children who have learning, social or behavioral challenges

## Community Engagement Workforce Development

Tesla is committed to positively impacting and strengthening the communities in which we live and work

We strive to accomplish this work through:

- Workforce development and education programs that provide access to the community we aim to support and create equity for our workforce;
- Building community connections to increase representation and ensure that job opportunities are promoted locally; and
- Supporting environmental equity and connecting underrepresented communities to our mission.

### Workforce Development

We are continuing to provide the local community access to thousands of job openings across the U.S. in manufacturing, vehicle service and solar roof installation, offering full benefits and training from day one. We have long stated publicly that candidates do not need to have a college degree to work at Tesla. This represents an enormous opportunity for high school graduates from underserved communities to join us in our mission and grow their careers.

**Tesla START** is an intensive training program that provides students across North America with the skills necessary for a successful career at Tesla and beyond. During the program, students develop technical expertise and earn certifications through in-class theory, hands-on labs and self-paced learning. We partner with community colleges across the country to integrate Tesla START into automotive and manufacturing curriculums as a multi-week capstone. Since the launch over START over 550 students have been placed in full-time employment at Tesla.

**Tesla's Manufacturing Development Program** is a two-year program where recent high school graduates in the U.S. start a career at Tesla as a Production Associate while continuing their education in automation and robotics at a local community college. To date, we've hired 168 graduates into this program since launching in 2017, with active programs at Gigafactory Nevada, Gigafactory New York and our Fremont Factory. We also launched our first Manufacturing Development Program class with Del Valle High School to support Gigafactory Texas in fall 2021.

**Tesla's Tool & Die Apprenticeship** Tesla offers a federal and state certified Tool & Die Apprenticeship program in the U.S., in partnership with local community colleges, at the Fremont Factory, Gigafactory Nevada and Tesla Grand Rapids. These apprenticeships blend on-the-job training by qualified mentors with classroom learning, providing a holistic approach to learning a trade in high demand. Apprentices learn welding, machining, blueprint reading and other critical skills.

## Community Engagement Education Programs

When Gigafactory Nevada was announced in 2014, Tesla committed to invest \$37.5 million in K-12 Education across the state. This investment is directed at initiatives that support the acceleration of robotics and sustainability programming within Nevada's K-12 education system and is focused on directly supporting the development of future engineers in Nevada. Below is a snapshot of two organizations we have collaborated with.

### Nevada Robotics

Tesla is a founding partner of Nevada Robotics, a non-profit focused on supporting the acceleration of K-12 robotics programs at every school in Nevada. Through the support of robotics organizations locally, like FIRST Nevada and VEX Robotics, after school robotics teams participating in the program in Nevada have grown from 270 to over 700, and student participation has increased by over 4,000 students annually to 6,400. Nevada Robotics has also supported robotics trainings for over 400 teachers by providing equipment, coaching stipends and externship opportunities to help empower teachers to bring this new field to life in their classrooms.

### Envirolution

Envirolution is a Nevada based non-profit that focuses on providing teachers with valuable sustainability curriculum, classroom resources and professional development. Tesla has supported over 170 teachers from 75 schools in Nevada in launching student-driven sustainability initiatives that have led to over 8,600 MWh in energy savings. In 2019, Envirolution launched Career Quest, a field trip initiative that connects students to careers across their region. To date, over 1,500 students have participated in Career Quest at Gigafactory Nevada.

## Community Engagement Community Connection Programs and Experiences

Our community connection programs and experiences are designed to increase representation and provide equitable outcomes for underrepresented groups. We offer first-in-line employment opportunities to program participants. We inspire students to see the possibilities of an amazing career with Tesla. We are continuing to provide employees with the programs, tools, resources and support that have been proven to foster inclusion. We inspire our employees to progress in their careers as far as their talent will take them.

### Introduce a Girl to Engineering Day

To help encourage young women to see engineering and manufacturing as a desirable career path, Tesla hosted over 400 girls at 11 sites in 5 states in the U.S. for Introduce a Girl to Engineering Day. Tesla volunteers led the students through facility tours and hands on STEM activities. They also heard from the women of Tesla who lent their expertise and experience to encourage the young female students to see technology as a tool to pursue their future career interests.

### Manufacturing Day

In celebration of National Manufacturing Day in the U.S., which takes place annually on the first Friday in October, Tesla hosted events in Fremont, California and Austin, Texas (held virtually in 2020 due to COVID-19 safety precautions) engaging several hundred students, parents, teachers and community leaders through virtual factory tours, panel discussions and sharing manufacturing career opportunities to inspire young people to explore manufacturing careers at Tesla.

### Tesla Connect

Over the years, we have hosted thousands of visitors at Gigafactory Nevada, Gigafactory New York and the Fremont Factory in California to give guests an opportunity to see the manufacturing process firsthand. In 2020, we created Tesla Connect to expand our reach with students and community members across the globe. Tesla Connect provides virtual tours, info sessions and Q&A discussions to share an in-depth look at the Tesla ecosystem.

### Tesla Impact

Tesla Impact was relaunched in October 2020 to provide opportunities for Tesla employees to give back to the community by supporting mission-driven causes and organizations through volunteer programs and events. Employees across the U.S. had the opportunity to participate in blood drives, in-person and virtual volunteering, mentoring opportunities and charitable collections to benefit community organizations where they live and work.

## Community Engagement Environmental Equity Initiatives

At Tesla, we are committed to using our products to provide economic and environmental benefits to the communities that are most impacted by the effects of climate change and natural disasters.

- Nearly 37 million American homes suffer from energy poverty, which is the inability for a household to meet its energy needs. This makes them vulnerable to detrimental health effects during periods of intense heat or cold.
- Energy poverty results from income inequality and inequalities in energy prices, housing and energy efficiency.
- Despite consuming less energy on average, low-income households spend three times as much of their income on energy than non-low-income households.

To foster environmental equity, we are committed to the following:

### In-Kind Product Donations

Since 2017, Tesla has donated 1,700 kW of solar panels to over 108 systems at 14 installations through GRID Alternatives. This has equated to \$2.5 million in lifetime savings for low-income families, with over 6,000 tons of carbon emissions prevented, the equivalent of planting 138,000 trees.

Our 70kW solar system installed on Erie Community College's Center for STEM studies not only generates energy contributing directly to the building's electrical supply, but it also provides energy to ten electric vehicle charging stations across three campuses. Live energy output data is used by faculty and students for academic purposes.

Since 2019, Tesla has donated approximately 400 Destination Charging connectors to Parks Canada for use in 28 of their most popular destinations and to University Health Network in Toronto. These donations help each organization to meet their sustainability goals while also increasing access to recreational and health infrastructure to EV owners in Canada.

### Disaster Relief Efforts

In 2020, Tesla supported relief efforts associated with Hurricane Laura in Louisiana and the Oregon Wildfires. In total, four sites were supported through the deployment of seven Mobile Power Units supporting the needs of local residents and providing power to over 100 families.

## Diversity, Equity & Inclusion

As we work to achieve our mission for a more sustainable future, we reaffirm our commitment to Diversity, Equity and Inclusion (DEI). We are proud to employ people from all backgrounds who possess the talent, energy and focus to accelerate our vision forward. Each employee is encouraged to bring their whole self to work, knowing that Tesla values individuality as much as we value collaboration. To demonstrate our commitment to DEI, we published our first [DEI Impact Report](#) in December of 2020, for data collected between January-September 2020 for full-time employees in the U.S. The following is a further update of our first DEI Impact Report in order to provide the full-year 2020 calendar year data. Moving forward, our annual DEI Impact Report data will be published within this annual Impact Report.

### Our Diversity, Equity and Inclusion Principles

Our DEI team uses a people-first and data-driven approach to champion diversity, equity and inclusion in our business and in the communities in which we operate. We rely on the following guiding principles in our work to inform company policies and practices:

- Provide transparency in our DEI programs and results to measure our progress, identify areas of improvement, celebrate successes, and continually iterate and improve our DEI approach;
- Integrate accountability measures for organizational, team and individual progress and results into our business operations;
- Focus on sustainable solutions that solve problems at the root cause and reimagine new programs with Diversity, Equity and Inclusion principles embedded in the design; and
- Share knowledge throughout all levels of the organization to aid in personal and professional learning and development.

### Our Diversity, Equity and Inclusion Principles in Action

Tesla is not a company that rests on past successes or settles for the status quo. We set high standards for everything we do, and we are committed to bringing that same bias for excellence to DEI at Tesla. The road to success is paved with action—especially in difficult times. We are backing up our commitment to DEI by expanding our team, adding company-wide talent development and learning programs to our function and embedding DEI principles in everything that we do. From our engagement with candidates to our outreach to community members, we are intentional as we work to encourage people from all backgrounds to join us on our mission to accelerate the world's transition to sustainable energy.

We are investing in communities like Fremont, California; Reno, Nevada; Buffalo, New York; and Austin, Texas, to support workforce development and education programming, community engagement and environmental equity initiatives. Our supplier diversity program, formally revamped in 2020 and in place under the Diversity, Talent & Learning team, will support businesses as they grow in the global market and become a key component to our collective success. We are reaching out to further engage the communities where our employees reside and work to inspire community members to join us on our mission.

## Diversity, Equity & Inclusion

### Underrepresented Communities in the U.S.

#### Underrepresented communities in the U.S.: Tesla is a majority-minority company

Black, African American, Hispanic, Latinx, Asian, Pacific Islander, Native American, Native Hawaiian and Alaska Native communities are typically underrepresented in the U.S.; however, we are pleased to report that this group collectively represents 61% of our workforce. The same group is typically even more underrepresented in corporate leadership. As of December 31, 2020, 33% of our directors and vice presidents were from underrepresented communities. This is a large percentage of a very small cohort—less than 0.3% of employees are director level and above at Tesla. We are proud to be a majority-minority company with a business that reflects the underrepresented communities that have long struggled to break through the roadblocks to equal opportunity in the U.S.

Black and African American employees are 10% of our U.S. workforce. In 2020, this group experienced an increase in representation in management, ultimately representing 4% of our director-level and above employees. Black and African American employees comprised 13% of new hires and 10% of promotions respectively—both increases from 2019; however, we know that our numbers do not yet represent the deep pools of Black and African American talent that exist in the U.S at every level—from high school graduates to professionals. Many of our programs in 2021 will focus on increasing Black and African American representation at Tesla, especially in leadership, while continuing the upward trend in new hires and promotions.

Asian employees are 20% of our U.S. workforce and have also seen an upward trend in representation in management, ultimately representing 24% of our director-level and above employees. Asian employees comprise 17% of all new hires and 22% of all promotions. We want to see these trends continue to improve in 2021 and beyond.

Hispanic and Latinx employees are 24% of our U.S. workforce, and while they currently represent only 4% of our director-level and above employees, they represented 24% of all promotions in 2020—reflecting a 14% growth from 2019 and Tesla’s active efforts at cultivating and developing diverse talent. Additionally, 30% of all new hires in 2020 were Hispanic and Latinx. We also want to continue in 2021 and beyond the positive upward trends we are experiencing across hiring, promotions and overall representation for our Hispanic and Latinx employees.

#### Underrepresented Communities Representation in our U.S. Workforce

20%	10%	24%	7%	32%
Asian	Black	Hispanic	Additional Groups	White

#### Underrepresented Communities in Leadership Representation in our U.S. Workforce

24%	4%	4%	1%	59%
Asian	Black	Hispanic	Additional Groups	White

Data are representative of calendar year 2020, as measured on December 31, 2020. Totals may not add to 100% due to rounding or individuals who selected “decline to state” or left the category blank.

## Diversity, Equity & Inclusion

### Gender & Veteran Representation in the U.S.

#### Gender Representation in the U.S.

Women represent 22% of our overall U.S. workforce and 23% of all promotions—a 5% growth from 2019. They represent 19% of our directors and vice presidents. In 2020, nearly 25% of all U.S. hires were women.

Women are historically underrepresented in the tech and automotive industries, and we recognize we have work to do in this area. We are committed to working alongside other companies to help broaden the range of opportunities for women throughout these industries. We are taking active steps to increase our outreach to women and build an inclusive culture that supports their development and retention. Increasing women’s representation at all levels, especially in leadership, is a top priority in 2021.

#### Gender Representation in our U.S. Workforce

Female	Male
22%	78%

#### Gender Representation in Leadership in our U.S. Workforce

Female	Male
19%	81%

#### Veteran Representation in the U.S.

Veterans represent 4% of our overall U.S. workforce. They represent 4% of our directors and vice presidents. In 2020, 3% of all U.S. hires were veterans.

Our veteran population includes members from the Air Force, Army, Coast Guard, Navy and Marine Corps and from all modern eras of service. In 2021, we will focus heavily on connecting transitioning veterans to opportunities through our partnership with Hiring Our Heroes and apprenticeship programs.

#### Veteran Representation in our U.S. Workforce

Veteran	Non-Veteran
4%	96%

#### Veteran Representation in Leadership in our U.S. Workforce

Veteran	Non-Veteran
4%	96%

Data are representative of calendar year 2020, as measured on December 31, 2020. Totals may not add to 100% due to rounding or individuals who selected “decline to state” or left the category blank.

## Diversity, Equity & Inclusion Our Roadmap

Our DEI Roadmap—outlined below—highlights the steps we will continue to take in order to improve on our diversity and inclusion metrics and integrate DEI best practices into our business operations. Our approach is simple:

### Focus

on attracting, developing and retaining excellent talent

### Integrate

diversity, equity and inclusion principles and practices into the DNA of our company

### Connect

communities internally and externally to opportunities with Tesla

#### Focus on attracting, developing and retaining excellent talent

In 2020, we took concrete steps to attract, develop and retain top talent. We focused internally on upskilling and retooling our recruiting organization. During our first DEI Recruiting Summit, we shared tools and best practices with the entire global organization for scouting and landing the best talent from underrepresented communities. All participants completed our customized unconscious bias training for recruiters. This Summit will become an annual tradition that we hope to expand upon in 2021.

We expanded our Internship Program to become our driving force in attracting diverse talent at our professional entry level. The program is intended to convert college students into employees for early career opportunities across our entire business. In 2020, we hosted more than 1,400 interns during the spring, summer and fall. We built exciting internships and co-op experiences that integrated into the core fundamentals of our businesses: Manufacturing, Energy and Technology. Interns joined us from all around the world and completed internships in the U.S., EMEA and APAC.

We also expanded our military fellowship program in 2020 by partnering with the Air Force Education with Industry Program and the Secretary of the Navy's Tour with Industry Fellowship Program. The 2020 fellows spent the year immersed in our energy, construction and logistics organizations gaining invaluable insight and perspective to help accelerate innovation upon their return to active duty.

#### Integrate Diversity, Equity and Inclusion principles and practices into the DNA of our company

In 2020, we instituted quarterly diversity data reviews across our different divisions – this ensures that we identify trends and needs across functions instead of simply looking at our workforce at the company-wide level. Each executive reviews their organization's demographic data from a variety of angles and works with their DEI, HR and Recruiting partners to create an action plan to attract, develop and retain talent.

As a result of integrating the talent management function into the DEI function, we were able to deliver a consistent and fair performance review process in which 99% of all U.S. employees were rated on their performance. The program has led to improvements in our internal mobility program and employee's access to career opportunities within Tesla.

We expanded our leadership development team with a focus on providing DEI offerings to all our U.S. employees. Now all employees are introduced to our DEI principles on Day 1 of their employment in New Hire Orientation and have the opportunity to continue their DEI learning journey throughout their career at Tesla. From our allyship resources and DEI Life Hacks on our DEI Knowledge Center to virtual instructor led courses on unconscious bias, inclusive interviewing and inclusive leadership, our employees now have access to information no matter where they located in the world or are in their own knowledge journey.

## Diversity, Equity & Inclusion Our Roadmap

Our DEI Roadmap—outlined below—highlights the steps we will continue to take in order to improve on our diversity and inclusion metrics and integrate DEI best practices into our business operations. Our approach is simple:

### Focus

on attracting, developing and retaining excellent talent

### Integrate

diversity, equity and inclusion principles and practices into the DNA of our company

### Connect

communities internally and externally to opportunities with Tesla

Connect communities internally and externally to opportunities with Tesla

We focused a great deal of our efforts on expanding our Community Engagement and ensuring our employees stayed connected during the global pandemic.

We expanded our Employee Resource Groups (ERGs) and were hyper focused on ensuring our programming was accessible in the new remote work environment. We welcomed Asian Pacific Islanders at Tesla to our ERG family. While this was a time of uncertainty and change, through our ERGs, we ensured our employees felt more heard and connected than ever before as they pivoted to virtual events to promote inclusion across different locations, physical boundaries and time zones.

In response to the global outcry for social justice sparked by the murder of George Floyd, we developed our internal Listen to Understand Series. The series is a monthly listening opportunity for all employees to witness powerful storytelling from our leaders and colleagues as a way to better understand the challenges some members of underrepresented communities face in their quest to bring their whole selves to work and build understanding and empathy for one another to help us all navigate our relationships at work and home. Topics we had the opportunity to discuss include overcoming imposter syndrome, navigating unconscious bias and perceptions, addressing the impact of microaggressions as well as other practical ways to foster allyship and inclusivity to allow our employees to always bring whole selves to work.

We formalized collaboration between the DEI, Supply Chain and Government Affairs teams to ensure local minority, women, LGBTQ, disabled and veteran owned businesses are connected to opportunities with Tesla. Tesla recognizes that supplier diversity creates a competitive advantage for the company and has a positive impact on the global community. As the supplier diversity program develops, we will implement plans that encourage increased usage of diverse suppliers throughout our organization, partner with internal and external stakeholders to identify opportunities for diverse suppliers and work with external partners to encourage capacity building for diverse suppliers. At Tesla, we strive to have a diverse supply chain and provide the maximum practical opportunities to provide goods and services as a part of the corporate procurement process.

## Diversity, Equity & Inclusion Governance

### Gender Representation Board of Directors

Female	Male
22%	78%

### Underrepresented Communities Board of Directors

11%	11%	11%	66%
Asian	Black	Hispanic	White

## Our Diversity, Equity & Inclusion governance

Our DEI governance structure supports our business operations. Our VP of People engages with our Board of Directors to ensure our DEI plans are in alignment with Tesla's strategic objectives. We also integrate our Talent Management and Learning and Development into the DEI functional scope to ensure fair and equitable talent, career and learning resources and programs are in place and accessible to all employees. The DEI director reports directly to the VP of People and has regular engagement with company executives across the company to ensure that DEI principles are embedded into our business. The DEI director also has responsibility for all of Tesla's Talent Management and Learning programs.

## Where we are today

We set our own high standards for excellence, including how we evaluate our DEI practices and programs. Where we are today represents the progress that we have made and the steps we have taken throughout 2020. We know we have more work to do to be representative of the evolving U.S. population, and we are committed to implementing the plans we've designed to get us there.

## Our Board of Directors

The increasingly diverse representation on our Board of Directors sets the tone for the rest of the company.

## Corporate Governance Introduction

Our Board of Directors serves as a fiduciary for shareholders and oversees the management of the Company’s business—which includes oversight of the Company’s ESG impacts, initiatives and priorities. With those responsibilities in mind, the Board sets high standards for our employees, officers and directors; and we periodically add new, highly qualified independent directors to the Board, such as Larry Ellison and Kathleen Wilson-Thompson in 2018 and Hiromichi Mizuno in 2020. Implicit in this approach is the importance of sound corporate governance.

We believe that sound corporate governance is critical to helping us achieve our goals, including with respect to ESG. We are committed to establishing an operating framework that exercises appropriate oversight of responsibilities at all levels throughout the company and manages its affairs consistent with high principles of business ethics.

Tesla aspires to be a “do the right thing” company. Our Code of Business Conduct and Ethics sets out basic principles that should help anyone working at or for Tesla avoid even the appearance of improper behavior. Tesla’s Code of Business Conduct and Ethics and our Corporate Governance Guidelines are each available on Tesla’s website at: <http://ir.tesla.com/corporate-governance/highlights>.

In addition, we believe in regular and transparent communication with employees. We encourage Tesla employees to share their feedback openly (and anonymously, if they prefer), and the company provides easy methods to do so. We regularly conduct employee surveys to identify strengths and opportunities for improvement. We have a robust action planning process to ensure we proactively address the concerns or feedback.

We also have a whistleblower hotline through which employees can report concerns at any time. The company keeps information reported by employees in confidence, whether through the hotline or another channel. Our policies prohibit retaliatory actions against employees for raising concerns or making complaints. We are committed to maintaining an open and transparent culture where it is safe and acceptable for all employees to raise concerns about policy violations by their manager or colleagues or about the workplace overall.

## Corporate Governance

### Board Structure and Responsibilities

Our Board of Directors' commitment to guiding Tesla's long-term vision is a key component of our ability to execute upon our mission to accelerate the world's transition to sustainable energy. The Tesla Board has actively driven key decisions focused on achieving long-term growth and profitability, including decisions to:

- Develop, manufacture and sell a range of electric vehicles from the ground up, including luxury, affordable and commercial-use models, rather than simply build powertrains for OEMs;
- Deploy FSD city streets beta software to our fleet in order to develop complete full-self driving capability in the future;
- Establish Tesla-owned stores and service centers rather than use a franchised dealer system;
- Create a global network of Superchargers to enable long-distance EV travel;
- Build the world's largest battery factory to meet our needs and reduce battery costs;
- Expand into energy generation (solar) and storage through the acquisition of SolarCity Corporation in 2016 to create a vertically integrated sustainable energy company and empower individual consumers to be their own utility; and
- Compensate our CEO only if other shareholders realize tremendous value.

The Board is directly and regularly engaged with senior management and the Sustainability Council and participates in robust shareholder outreach and feedback. In addition, our directors have significant experience as either top-level executives at public companies, as successful investors or as entrepreneurs who founded successful organizations.

#### Committees of the Board

The Board has four standing committees—the Audit Committee, the Compensation Committee, the Nominating and Corporate Governance Committee and the Disclosure Controls Committee—which are each further described in the following pages. Each member of these committees qualifies as an independent director under the listing standards of NASDAQ. In addition, as part of our governance review and succession planning, the Board (led by the Nominating and Corporate Governance Committee) evaluates our leadership structure to ensure that it remains the optimal structure for Tesla, reviews the composition, size and performance of the Board and its committees, evaluates individual directors and identifies and evaluates candidates for election or re-election to the Board.

#### Board role in risk oversight

The Board is responsible for overseeing the major risks facing Tesla, while management is responsible for assessing and mitigating Tesla's risks on a day-to-day basis. In addition, the Board has delegated oversight of certain categories of risk to its independent committees, which then report to the Board, as appropriate, on matters that involve the specific areas of risk that each committee oversees.

## Corporate Governance

### Board Committees (as of June 1, 2021)

Name	Function	Year joined	Audit Committee	Compensation Committee	Disclosure Controls Committee	Nominating & Governance Committee
Robyn Denholm	Independent Board chair	2014	X	X	X	X
Elon Musk	Director and CEO	2004				
Ira Ehrenpreis	Independent director	2007		X		X
Larry Ellison	Independent director	2018				
Antonio J. Gracias	Independent director	2007	X			
Hirofumi Mizuno	Independent director	2020	X			
James Murdoch	Independent director	2017	X		X	X
Kimbal Musk	Director	2004				
Kathleen Wilson-Thompson	Independent director	2018		X	X	X

#### Audit Committee

The Audit Committee is responsible for, among other things, assisting the Board in providing oversight of Tesla's accounting and financial reporting processes and the audit of its financial statements, including oversight over the integrity of these statements, the Company's compliance with legal and regulatory requirements, the independent auditor's qualifications, independence and performance, the organization and performance of the Company's internal audit function, as well as the Company's internal accounting and financial controls, treasury and finance matters, and risk management including data privacy and cybersecurity.

#### Compensation Committee

The Compensation Committee is responsible for, among other things, discharging the Board's responsibilities in administering and overseeing Tesla's compensation policies, plans and benefit programs, the compensation of Tesla's executive officers and members of the Board and the administration of the Company's employee benefit plans.

#### Nominating and Corporate Governance Committee

The Nominating and Corporate Governance Committee is responsible for, among other things, reviewing and making recommendations to the Board on matters concerning corporate governance, Board composition, the identification, evaluation and nomination of director candidates and composition of Board committees and conflicts of interest. In addition, this Committee oversees Tesla's corporate governance practices and reviews annually the principles of corporate governance approved by the Board, including the Company's Code of Business Conduct and Ethics and Corporate Governance Guidelines, to ensure that they remain relevant and are being complied with and monitored by management, recommending changes to the Board as necessary.

#### Disclosure Controls Committee

The Disclosure Controls Committee, among other things, implements, reviews and monitors Tesla's compliance with applicable legal requirements governing the Company's and its executive officers' public disclosures and public statements relating to the Company.

## Supporting Materials

## Summary

Impact Area	Topic	Description	Page(s)
Environmental Impact	Lifecycle Analysis of Tesla Vehicles versus Average ICE	Regardless of where it is driven (U.S., Europe or China), a Model 3 made in Fremont emits far fewer greenhouse gas emissions per mile than a comparable ICE.	11 - 22
	NOx, Particulates and Other Pollutants	New research shows that fossil fuels are alone responsible for more than 8 million premature deaths annually, or almost one out of every five deaths globally, double previous estimates. Zero tailpipe emissions is a commonly overlooked benefit of EVs.	23
	Tesla Semi's Impact on Emissions	Tesla Semi is poised to make a large impact: in the U.S., combination trucks make up just 1.1% of the vehicle fleet but account for 17% of annual emissions.	24
	Battery Recycling	In Q4 2020, Tesla successfully installed the first phase of the cell recycling facility at Gigafactory Nevada for in-house processing of both battery manufacturing scrap and end-of-life batteries.	25 - 26
	Waste Generated per Vehicle Manufactured	As we continue to build new, more efficient factories our ability to limit packaging and reduce waste increases. Waste generated per vehicle in Shanghai production is 50% less than our manufacturing in the U.S. We continue to push for innovative approaches to reducing waste as we expand our global operations.	27
	Water Used in Vehicle Manufacturing	While water usage per vehicle was already below the industry average in 2020, new factories such as Gigafactory Berlin-Brandenburg will set a new standard when it comes to low water use per vehicle.	28 - 29
	Emissions Credits	In 2020, Tesla delivered 2x as many EVs as our next closest competitor, helping drive \$1.6bn in revenue from selling regulatory credits. This money is being used to accelerate our production capacity deployment in direct support of our mission.	30
	Net Energy Impact of our Products	Since we started producing Model S in 2012, Tesla solar panels have generated 8x more energy than our factories have consumed over the same period.	31
Product Impact	Product Affordability (Price Equivalency & Total Cost of Ownership)	Model 3 has achieved price parity with its ICE equivalents. But, when compared on a total cost of ownership basis, the Model 3 is much closer to a Toyota Camry on all-in cost per mile than to an ICE equivalent such as a BMW 3 Series.	33 - 34
	Product Usage & Usability	Our data show that Tesla vehicles are used as much as an average vehicle in the U.S., utilized for daily commutes, errands and long-distance travel alike. The superior range of our vehicles and a robust global Supercharger Network makes this possible.	35 - 36
	Active Safety	In 2020, a Tesla vehicle with Autopilot engaged in the U.S. experienced just 0.2 accidents per million miles driven while the U.S. average was ~9x higher at 2.0 accidents per million miles driven.	37

## Summary

Impact Area	Topic	Description	Page(s)
Product Impact	Passive Safety & Tesla Safety Awards	Tesla vehicles consistently achieve 5-star safety ratings in the U.S., Euro and Australasian NCAP programs. In 2020, Model X and Model 3 both earned 5-stars across all three programs while Model Y earned 5-stars in the U.S. (it was not yet available in Europe or Australia in 2020).	38 - 39
	Fire Safety	From 2012 to 2020, there has been approximately one Tesla vehicle fire for every 205 million miles traveled. Data from the National Fire Protection Association (NFPA) and U.S. Department of Transportation show that in the U.S., there is an average of one vehicle fire for every 19 million miles traveled.	40
	Cybersecurity	In order to ensure we have the best products in the world, we continually update them with our industry-leading over-the-air software updates, ensuring our customers always have the latest and greatest security and product features. We also actively engage with academic experts and security experts to ensure the best of the best are pressure testing our systems.	41
	Resilience of the Grid	Electric grid disturbances in the U.S. have increased dramatically over the last 15 years. Our solar and storage products not only deliver cost savings and energy independence, but they also harden the grid from adverse events in a cost-effective and environmentally friendly manner.	42 - 43
Supply Chain	Responsible Material Sourcing	While our complex supply chain is a unique hybrid of the traditional automotive and high-tech industries and encompasses suppliers from around the world, Tesla is committed to only sourcing responsibly produced materials.	45
	Cobalt in our Supply Chain	Tesla has reduced cobalt content in our cathode substantially over the years; however, as long as cobalt is in our supply chain, we are committed to fair and responsible sourcing that follows internationally accepted guidelines while supporting the communities from which we source.	46-49
	Battery Materials Sourcing	Tesla continues to map our supply chain and prioritize the largest risks and opportunities. In 2020, lithium and nickel became major themes given their contribution to greenhouse gas emissions, as well as environmental and human rights challenges within the supply chain.	50-53
People and Culture	Our People Strategy	Tesla's employees are its greatest asset and critical to achieving our mission. At the center of our People strategy is regular and meaningful engagement with our employees, a robust culture of safety, clear development pathways for all our employees, highly competitive compensation programs, and principles of diversity, equity and inclusion built into all aspects of hiring, promotion and retention.	55
	Our Response to COVID-19	Tesla began preparing for COVID-19 in December 2019, well before it became a major theme in the U.S. We quickly updated policies, procedures and many of our business processes to ensure the health and safety of our employees and customers. In 2020, Tesla had fewer than 40 workplace transmission cases of COVID-19 and our employee positivity rate was less than half the community rate.	56
	Human Rights	Tesla believes the ethical treatment of all people and regard for human rights is core to our mission of a sustainable future and believe all businesses within our supply chain have a responsibility to support our mission and share our respect for human rights.	57 - 58

## Summary

Impact Area	Topic	Description	Page(s)
People and Culture	Employee Engagement	Since our earliest days, Tesla has been built upon a culture of open communication. We have many channels, both formal and informal, including our Integrity Line, for employees to express concerns or receive feedback. Employees are free to discuss their wages, benefits and terms of employment and to raise complaints internally or externally.	59
	Our Environmental, Health, Safety and Security Strategy	At Tesla we are driving safety by focusing on what is happening today and listening to those who do the work. In 2020 alone, we had over 1.3 million EHSS engagements with our employees. Our EHSS strategy remains: 1. Do the basics right; 2. Engage and empower our stakeholders; and 3. Reduce risk.	60
	Safety Improvements	In 2020, we further reduced of injuries per car produced while our total production continued to accelerate. More important to us, however, is our focus on incorporating a human and organizational philosophy and organizational learning when incidents happen.	61 - 63
	Rewarding the Individual	Tesla proudly offers a comprehensive range of benefits options to support our employees' health and well-being in every region of the world in which we operate.	64 - 66
	Community Engagement	Tesla is committed to positively impacting and strengthening the communities in which we live and work. We strive to accomplish this work through workforce development and education programs, building community connections and supporting environmental equity.	67-70
	Diversity, Equity and Inclusion	To demonstrate our commitment to Diversity, Equity and Inclusion, we published our first DEI Impact Report in December of 2020. Tesla is a majority-minority company: underrepresented groups make up 62% of our U.S. workforce.	71 - 76
	Corporate Governance	We believe that sound corporate governance is critical to helping us achieve our goals, including with respect to ESG. We are committed to establishing an operating framework that exercises appropriate oversight of responsibilities at all levels throughout the company and manages its affairs consistent with high principles of business ethics.	77 - 79

## Appendix

### Our Materiality Analysis

In 2021, we conducted a comprehensive materiality analysis to better understand the key ESG topics that were most salient to our diverse group of stakeholders. To start, we identified over 40 issues in key areas that could directly or indirectly impact our business. The topics ranged from economic, environmental, social and governance issues. These issues were identified from four components: (1) a competitive landscape review, (2) interviews with investors and other key external stakeholders, (3) industry reports and documented research, such as the World Economic Forum’s 2021 Global Risks Report and (4) external ESG frameworks relevant to our industry and regulatory requirements across global capital markets.

Tesla’s Sustainability Council refined the list of 40 key issues into a survey containing 25 questions in an effort to help us prioritize these topics for operational management and disclosure in this year’s Impact Report. As part of the assessment, we surveyed our key stakeholders, asking them to rate the identified economic and ESG topics on a scale of 1-5, based on their perceived importance and impact to Tesla’s business. A total of 2,168 individuals from Tesla and approximately 40 external partners, including trade associations, universities, suppliers, environmental consultants, nonprofits and local administrators, responded to the survey. 35% of responses came from North America, 57% from China and 8% from Europe. Below are the top issues identified by our materiality analysis, in order of importance to survey responders.

1. Environmental Management, Reducing Carbon
2. Quality Management- Product Safety
3. Employee Workplace Safety
4. Employee Attraction, Retention, Development
5. Ethical Business Conduct, Integrity, Transparency
6. Data Protection, Cybersecurity
7. Supply Chain Management, Sustainable Materials/Products
8. Customer Satisfaction, Trust and Loyalty
9. Company Brand and Mission
10. Employee Health and Wellness
11. Company’s Intellectual Property, Innovation, R&D
12. Renewable Energy
13. Waste Management/Recycling
14. Company Financial Health ( Product Sold, Profitability)
15. Employee Compensation and Benefits
16. Air Quality, Reducing Toxic Emissions
17. New Markets, EV, Autonomous Cars
18. Labor Relations
19. Water Management
20. Diversity, Equity and Inclusion
21. Climate Change and Risk Management
22. Biodiversity Preservation, Natural Resource Conservation
23. Human Trafficking, Forced Labor
24. Critical Events, Disaster Relief, Pandemic
25. Community Engagement, Economic Development

**Appendix**  
Stakeholder Engagement

Managing a successful and effective ESG program requires robust engagement with an entire ecosystem of stakeholders – both internal and external to Tesla – including our employees, customers, investors, suppliers, non-profit organizations, educational institutions, governments, the communities in which we operate and trade associations. These groups, among others, all have a stake in the success of our businesses - they are people or organizations who are affected by or can impact our operations. For our business to continue to grow, we need to keep innovating, developing new products and markets all in a sustainable manner. We do this by attracting and retaining the best employees, serving our customers and investors and working with non-profits, our local communities, schools, governments and trade associations to make a positive impact.

## Appendix

### Tesla's Alignment with the United Nations' Sustainable Development Goals

In 2015, the United Nations defined a blueprint of 17 sustainable development goals to meet the urgent environmental, political and economic challenges facing our world. We understand that companies can play a critical role in providing solutions to these challenges. Our mission to accelerate the world's transition to sustainable energy directly addresses some of these challenges - our products and services have helped to create industry demand for sustainable energy products.

In 2021, as part of our Environmental, Social and Governance program, we reviewed the issues and topics most material to Tesla (identified on page 84) and key areas of focus for the Company and mapped them to the most relevant Sustainable Development Goals:

United Nations Sustainable Development Goals:	Material Issues and Topics and Other Key Areas of Focus
 	<ul style="list-style-type: none"> <li>- Technological innovation in manufacturing</li> <li>- Development of zero-emission technologies</li> <li>- Reduction of carbon emissions from transport and energy generation</li> <li>- Increase renewable energy generation</li> <li>- Further improve product affordability and accessibility</li> </ul>
	<ul style="list-style-type: none"> <li>- Environmental/climate change management and reporting</li> <li>- Reduce carbon footprint across Scope 1, 2 and 3 emissions</li> </ul>
  	<ul style="list-style-type: none"> <li>- Responsible supply chain management and sourcing</li> <li>- Reduce injuries and deaths from traffic accidents</li> <li>- Reduce deaths and illnesses from air, water and soil pollution</li> <li>- Waste reduction and responsible management supply chains</li> <li>- Reduce stress on water systems through efficient use of water in manufacturing</li> </ul>
  	<ul style="list-style-type: none"> <li>- Workforce development, education and training</li> <li>- Diversity, Equity and Inclusion</li> <li>- Human capital management and employee development</li> <li>- Community engagement</li> </ul>
	<ul style="list-style-type: none"> <li>- Ethics, corruption and bribery, human rights and labor relations</li> <li>- Human trafficking and responsible supply chain management</li> </ul>

## Key Metrics

### Waste Generated in Manufacturing

Waste Generated in Global Manufacturing <sup>1</sup> (2020; metric tons)		Diverted from Disposal	Directed to Disposal
Hazardous Waste		7,678	5,671
Non-Hazardous Waste		202,387	31,776
Total Waste Generated		210,065	37,447

Waste Generated in Vehicle Manufacturing <sup>2</sup> (2020; kg per vehicle)		Diverted from Disposal	Directed to Disposal
Hazardous Waste		14	11
Non-Hazardous Waste		394	60
Total Waste Generated per Vehicle		409	72

### Water Withdrawal for Manufacturing (cubic meters)

Total Fresh Water Withdrawal <sup>1</sup>	2018	2019	2020
Major Manufacturing Sites	1,548,874	1,765,374	2,082,163

Total Fresh Water Withdrawal per vehicle <sup>2</sup>	2018	2019	2020
Vehicle Manufacturing Sites	3.27	2.43	3.10

### Cumulative Energy Used in Manufacturing versus Produced by Tesla Solar Panels (GWh)

Cumulative Energy Used <sup>3</sup>	2018	2019	2020
Major Manufacturing Sites - Zero-Emission	331	534	789
Major Manufacturing Sites - Fossil Fuel	809	1,231	1,824

Cumulative Energy Generated	2018	2019	2020
Tesla Solar Panels	12,933	16,649	20,863

### Vehicle Safety

Numbers of Vehicular Accidents per Million Miles Driven (2020)	Autopilot Engaged	Active Safety Features Only	No Active Safety
Tesla Vehicles	0.24	0.46	0.67

Number of Vehicle Fires per Billion Miles Driven	2018	2019	2020
Tesla Vehicles (since 2012, cumulative)	5.88	5.71	4.88

<sup>1</sup> Includes all major manufacturing sites: Fremont Factory and supporting facilities, Gigafactory Nevada, Gigafactory New York, Tesla Grand Rapids and Gigafactory Shanghai.

<sup>2</sup> Includes major manufacturing sites dedicated to vehicle production: Fremont Factory and supporting facilities, Gigafactory Nevada Vehicle Operations, Tesla Grand Rapids and Gigafactory Shanghai.

<sup>3</sup> Please see page 92 of the appendix for detailed explanation of energy consumption figures.

## Appendix

Metric / Disclosure / Topic	Source(s)	Methodology / Definition
As a result, it is not uncommon for the carbon footprint of the use phase to be underreported by up to 50%.	OEM sustainability reports	Analysis of sustainability reports by auto OEMs shows unrealistic assumptions for both vehicle life and annual mileage. For those that disclose their methodology we have found that vehicle life is often estimated to be as low as 10 years and annual distance traveled by vehicles as low as 6,200 miles. This compares to an average life of 17 years in the U.S. (20 years in Europe) and 12,000 annual miles in the U.S. (and 7,450 in Europe). When taken together, even before considering the impacts of using real-world MPG instead of NEDC, WLTP or EPA ratings, this leads to a drastic under-reporting of Scope 3 emissions.
5.0 million metric tons of CO <sub>2</sub> e savings	Tesla estimate	To estimate CO <sub>2</sub> e savings, we first measured the amount of miles driven and kWh of electricity generated at the state, province, and country level for 2020. We then applied an emissions savings factor (in gCO <sub>2</sub> e/mi for miles driven and gCO <sub>2</sub> e/kWh for electricity generated), for each state, province, and country. For miles driven, the emissions savings factor is the net of estimated emissions from our vehicles and an ICE with a real-world fuel efficiency rating of 25 mpg. The emissions savings factor is based on grid emissions intensity in each respective location and includes upstream emissions from the production and transport of fuels. We modeled vehicle emissions savings for the U.S., E.U. + EFTA and China, which account for ~90% of miles driven globally. We then scaled the savings to account for 100% of miles driven by dividing by ~90% and arriving at a global estimate for 2020.
Global Greenhouse Gas (GHG) Emissions by Economic Sector	CAIT data: Climate Watch. 2020. GHG Emissions. Washington, DC: World Resources Institute. Available at: <a href="https://www.climatewatchdata.org/ghg-emissions">https://www.climatewatchdata.org/ghg-emissions</a> .  Land Use Data Source: Food and Agriculture Organization of the United Nations. FAO 2020, FAOSTAT Emissions Database. Latest update: 2020. Accessed: June 2021. <a href="https://www.climatewatchdata.org/ghg-emissions">https://www.climatewatchdata.org/ghg-emissions</a>	For simplicity, select categories were combined based on similarity of emissions source. Emissions from Agriculture were combined with emissions from Land-Use Change and Forestry under the label "Agriculture, Land-Use Change and Forestry." Emissions from Industrial Processes were combined with emissions from Manufacturing/Construction under the label "Industry." Emissions from Waste, Fugitive Emissions, Other Fuel Combustion and Bunker Fuels (U.S.-only) were combined under the label "Other Energy."
Scope 1, 2 and 3 Emissions Definition	Greenhouse Gas Protocol	Scope 1 emissions are direct emissions from owned or controlled sources. Scope 2 emissions are indirect emissions from the generation of purchased energy. Scope 3 emissions are all indirect emissions (not included in scope 2) that occur in the value chain of the reporting company, including both upstream and downstream emissions. Emissions from the use of a company's products are included in Scope 3.
5,340 miles At the moment, the manufacturing process of a Model 3 results in slightly higher GHG emissions than an equivalent combustion engine vehicle. However, based on the global weighted average grid mix, a Model 3 has lower lifetime emissions than an equivalent ICE after driving 5,340 miles.	Tesla estimate	Estimate is based on the difference in CO <sub>2</sub> e emissions from the manufacturing phase on a Fremont-made Model 3 and an equivalent ICE which is then divided by the net CO <sub>2</sub> e savings per mile from a Model 3 versus an equivalent ICE. Net CO <sub>2</sub> e savings are based on delivery-weighted global grid mix.
69 tons: Lifetime CO <sub>2</sub> emitted by an average combustion engine vehicle (model year 2020) sold in the U.S. through its use phase, excluding CO <sub>2</sub> emitted during the oil refining phase.	Tesla estimate based on the EPA 2020 Automotive Trends Report	Figure based on EPA's real-world (5-cycle) testing result of 25.7 MPG across all manufacturers for model year 2020, which equates to 344gCO <sub>2</sub> /mi, and 200,000 lifetime miles. Excludes CO <sub>2</sub> emitted during fuel production and transportation. Note: the EPA's real-world testing cycle is not the same as owner-reported MPG sourced from Consumer Reports.

# Appendix

Metric / Disclosure / Topic	Source(s)	Methodology / Definition
Manufacturing Phase Emissions for Average Mid-Size Premium ICE	Tesla, Sphera Solutions	<p>In order to estimate the cradle-to-gate carbon footprints (GWP100) of select benchmark vehicles, a simplified approach of multiplying their curb weights by a carbon intensity of ~5.5 kg CO<sub>2</sub>e/kg was chosen. This reference value is based on a currently produced mid-size premium sedan that is comparable to the Model 3. The accuracy of this estimate for the other ICE vehicles directly depends on how their material compositions compared to that of the reference vehicle as well as on the existing variability of environmental impact profiles across different geographies and suppliers.</p> <p>As such, the specific carbon footprint (GWP100/kg) of the reference vehicle is only a proxy for the average premium mid-size ICE vehicle. Based on past work on automotive LCAs (Rohde-Brandenburger &amp; Koffler, 2019) (Koffler C. 873, 2013) (Koffler C., 2010) (Koffler C., Krinke, Schebek, &amp; Buchgeister, 2008) (Koffler C., 2007), the uncertainty of these estimates is estimated to be less than ±20% for a cradle-to-gate system boundary, and therefore less than ±5% once the use phase is added.</p> <p>The reference manufacturer's Environmental Certificates are calculated using the same BOM import functionality of the GaBi DfX software used for the Model 3 in the LCA authored by Sphera as well as GaBi 878 databases for all background data.</p> <p>Benchmark ICE vehicles include BMW 330i 2.0, Audi A4 2.0, Mercedes-Benz C300 2.0, Alfa Romeo Giulia 2.0, Volvo S60 2.0, Cadillac ATS 2.0, Lexus IS 300 2.0, and Infiniti Q50 2.0.</p>
Use Phase Emissions for Average Mid-Size Premium ICE	Consumer Reports, Sphera Solutions	<p>Figured based on owner-reported fuel economy from Consumer Reports for the latest available model year (2018-2020, depending on the make/model). 24.8 MPG is representative of the average of Alfa Romeo Giulia, Audi A4, BMW 330i, Cadillac ATS, Infiniti Q50, Lexus IS 300, Mercedes-Benz C300, and Volvo S60. Use phase GWP100 of ~400 gCO<sub>2</sub>e/mi includes gasoline production and distribution emissions from GaBi 2019 databases as well as consideration of bio-fuel mix of gasoline in the U.S. (~12%).</p>
Manufacturing Phase Emissions for Model 3	Tesla, Sphera Solutions	<p>Figure inclusive of: raw and semi-finished material production including transportation, mechanical processing and shaping, battery manufacturing, vehicle assembly and paint shop, all fuels and energy (natural gas, electricity, etc.), other auxiliaries (lubricants, water, etc.) and end-of-life disposal.</p> <p>Figure exclusive of: capital goods (e.g., machinery, buildings), infrastructure (e.g., roads, power transmission systems), employee commute, external charging equipment and infrastructure, maintenance and service during use, packaging, transport to recycler, disposal of manufacturing waste, inbound transportation from Tier 1 suppliers, distribution to customers. Excluded activities are estimated to represent minor contributions to the cradle-to-gate as well as the overall LCA results.</p> <p>Where solar and storage are assumed to be a fuel source for the use phase of the Model 3, emissions were included in the manufacturing phase figure. The Model 3 Rideshare Use (solar charged) scenario is allocated 100% of these emissions on a per mile basis, while the Model 3 Personal Use (solar charged) scenario is allocated 82% of these emissions and 18% grid-charged emissions on a per mile basis (based on observed supercharging vs. other split).</p>
Use Phase Emissions for Model 3	Tesla; U.S. Department of Energy; emeber-climate.org; Moro, A., Transportation Research Part D (2017), <a href="http://dx.doi.org/10.1016/j.trd.2017.07.012">http://dx.doi.org/10.1016/j.trd.2017.07.012</a> ; China Electricity Council	<p>Use phase emissions for grid charging are based on Model 3 delivery-weighted state, province and country level grid mix based on grid carbon intensity data.            U.S. Source: U.S. Department of Energy            E.U. Source: emeber-climate.org            EFTA Source: Moro, A., Transportation Research Part D (2017), <a href="http://dx.doi.org/10.1016/j.trd.2017.07.012">http://dx.doi.org/10.1016/j.trd.2017.07.012</a>            China Source: China Electricity Council's China Power Industry Annual Report 2020            Use phase emissions calculated using the geographic distribution of the Model 3 in the each respective region based on Tesla's delivery data, which weights state, province and country level carbon intensity figures and assumes no change in grid mix into the future. This is a conservative assumption based on recent new electricity generation capacity trends and commitments made by states and countries to increase renewable mix on their respective grids. Grid emission intensities include upstream emissions from the production and transport of fuels. Real-world observed efficiency of Model 3 over 10+ billion miles, inclusive of energy losses from grid to battery, utilized for use phase emissions calculations (converting gCO<sub>2</sub>e/kWh to gCO<sub>2</sub>e/mi).</p>

## Appendix

Metric / Disclosure / Topic	Source(s)	Methodology / Definition
Vehicle useful life	U.S. Department of Transportation, European Automobile Manufacturers Association, International Organization of Motor Vehicle Manufacturers, Association Auxiliaire De L'Automobile	To calculate scrappage age of vehicles in a region, you sum up annual vehicle sales from the most current year going back until the sum equals the current vehicle parc size. In order to be conservative, and normalize our figure based on recent vehicle sales trends in each region, we divided total vehicle parc by average vehicles sales in the respective regions for 2019 and 2020 (latest available data). This resulted in a scrappage age of 17 years and 200,000 miles in the U.S. and 20 years and 150,000 miles for Europe. For simplicity, China assumed to have similar useful life to Europe of approximately 20 years and 150,000 miles.
Energy Efficiency EPA range in miles/kWh	U.S. EPA, OEM data	Figures based on estimated EPA range and usable battery capacity disclosures by OEMs for each model. Where EPA range did not exist WLTP was used to determine a theoretical EPA range based on average EPA to WLTP ranges for other EVs.
Combination Trucks % of U.S. Fleet and U.S. Vehicle Emissions	U.S. EPA, U.S. Department of Transportation	% of U.S. Vehicle Fleet chart figures calculated using vehicle parc figures from U.S. Department of Transportation. % of U.S. Vehicle Emissions chart figures estimated using vehicle parc, fuel economy and VMT data from U.S. Department of Transportation. Calculation assumes fuel emissions factor for combination trucks are the same as the rest of the vehicle parc and are therefore conservative. Combination trucks use diesel fuel which, according to the U.S. EPA, has a higher GHG content versus gasoline used for light duty cars and trucks.
Water Consumption per Vehicle	Tesla, OEM Sustainability Reports	OEM data sourced from respective websites and latest available ESG reports. We have recently reviewed our water intensity data and redrew boundaries based on industry convention. Tesla's 2020 figure includes all our major manufacturing facilities dedicated to vehicle production, including an estimate for Gigafactory Nevada (actuals for 2020 for Gigafactory Nevada in later reports may vary upon confirmation of actual figures). It excludes Gigafactory New York, which produces solar and energy products.
Cumulative Energy Produced by Tesla Solar Panels vs. Consumed by Tesla Factories	Tesla	Figures based on actual electricity consumption from utility bills for 2018, 2019 and 2020. 2020 figure also includes measured consumption for on-site fuel use including propane, diesel and gasoline. Figures for 2012-2017 for electricity, and 2012-2019 for on-site fuel use, are estimated based on actuals scaled for vehicle and battery production for each respective year and facility.  Fossil fuel versus clean energy consumed at each facility for each year estimated based on state-level grid mix data from DOE for facilities in the U.S. and from country-level energy supply data from IEA for Gigafactory Shanghai.  We re-drew boundaries for this year's analysis based on industry convention. Previous disclosure included energy consumed to produce cells at Gigafactory Nevada and solar panels at Gigafactory New York. These are included in our suppliers' energy consumption footprints and were therefore removed from calculation for this report.
Total Cost of Ownership	Tesla, Edmonds, OEM websites, CarEdge	Figures reflective of model year 2020 estimates from various sources. Depreciation based on model year 2021 MSRP. Model 3 SR+ figures based on data from the Tesla fleet.
EV Range and Utilization Over First Three Years of Ownership	RAC Foundation, ev-database.org, fueleconomy.gov	Figures based on annual mileage for select non-Tesla EV models in the U.K. for 2017-2019. Non-Tesla EV models include BMW i3, Kia Soul EV, Mercedes-Benz B250e, Nissan Leaf 30kWh, and Renault Zoe Q210.  Real world data from the Tesla fleet was used to calculate the average annual mileage for all Tesla models.  EPA range sourced from fueleconomy.gov. Where EPA range did not exist WLTP was used to determine a theoretical EPA range based on average EPA to WLTP ranges for other EVs.
Tesla 2020 Supply Chain List of Miners & Refiners for Purchased Cobalt Materials	Responsible Minerals Initiative	RMI Classification: A smelter or refiner is considered "Conformant" when they have passed a third-party audit to industry accepted standards covering their internal processes and policies on due diligence to identify and mitigate the risk of human rights abuses in their supply chain; "Active" means a smelter or refiner is pursuing certification through one of the approved auditing processes; "Not Listed" means a smelter or refiner is not yet listed on the RMI's Cobalt Reporting Template and may not yet have been engaged by the RMI to participate in the RMAP or equivalent program.  Table reflects latest data available to Tesla as of the publishing of this report.

## Appendix

Except as otherwise noted, this report covers Tesla, Inc.'s fiscal year 2020, and references to "to date," "currently," or similar expressions reflect information as of December 31, 2020. Our data and methodologies have been collected and reviewed internally using relevant scientific and technical methodologies. Our statements about past occurrences and potential future development are based on data, estimates and assumptions made as of the date of publication. Certain information and data in this report may come from third-party sources and operations outside of our control. Tesla's ESG Sustainability Council actively reviews and updates our methodologies for calculating the metrics set forth in this report. From time to time, data reported for prior periods may change due to improvement in data collection and measurement, new data availability, methodological adjustments or activities related to mergers and acquisitions, and we reserve the right to revisit our prior historical data and estimates to ensure accuracy and make any necessary corrections to our public reporting. Tesla holds no obligation to update any information or statements in this report.

### Forward-Looking Statements

Certain statements in this report, including statements relating to future product development, performance and capability, timelines for the building of new factories and opening of new locations, expected cost savings from local manufacturing and materials recycling operations, the expansion of our Supercharger Network, future environmental sustainability efforts and expected efficiencies, data collection and reporting of results in subsequent Impact Reports are forward-looking statements that are subject to risks and uncertainties. These forward-looking statements are based on management's current expectations. Various important factors could cause actual results to differ materially, including the risks identified in our U.S. Securities and Exchange Commission ("SEC") filings and reports, including the risks identified under the section captioned "Risk Factors" in our quarterly report on Form 10-Q filed with the SEC on July 27, 2021 . Tesla disclaims any obligation to update any forward-looking statement contained in this report.

## General Public Comment:

Comment from John a resident living in South Pasadena on South Pasadena Police and Fire Department transition to Battery Electric Vehicle below:

I am in full support of South Pasadena Police Department going green, but I am concern that the vehicle they are picking is not police pursuit rated. Tesla has been used by many police department, but Tesla is not a police pursuit rated vehicle. I would think the best opinion would be the Hybrid Ford Police Interceptor Utility. To me the Hybrid Ford Police Interceptor Utility is the greenest and best police vehicle available. Also, the Hybrid Ford Police Interceptor Utility is police pursuit rated. I understand the push to go electric, but I would think South Pasadena Police Department would wait for the manufactures to create an electric patrol vehicle that is police pursuit rated and I believe the manufactures will create an electric police pursuit rated vehicle very soon. For the Fire Department I have no problem with this choice of vehicle because I have seen many different fire administrative vehicles be used across the United States and they do not need to be police pursuit rated. In addition, South Pasadena Police Departments need to update their current police vehicle fleet.

From John a resident living in South Pasadena
